As the Supreme Court turned its attention away from schools in the South to those in the North, the justices soon recognized that achieving desegregation in northern schools would require different methods than those used in southern schools. In the South, African Americans and Whites lived within close proximity of each other, and desegregation was achieved simply by assigning students to schools closest to their homes. This arrangement would not function as efficiently in the northern states because of segregated living arrangements.

Slow improvement was accomplished by some states, including North Carolina in *Swann v. Charlotte-Mecklenburg Board of Education* (1971), which delineated requirements to improve desegregation in North Carolina's school system by increasing bus transportation for African American students and new construction of schools near African American neighborhoods.

More than a decade after *Brown*, the Supreme Court held in the 1970s that faculty desegregation was a requisite component in the desegregation of schools, after district judges found that school boards had engaged in racially discriminatory hiring practices. These courts issued orders confirming the constitutional rights of students from minority groups to attend desegregated schools and school systems. Student educational rights were reiterated in *Hazelwood School District v. United States* (1977).

In the case of Boston, its period of desegregation began in the 1970s with *Morgan v. Hennigan* (1974), when parents of African American students brought a suit charging that the dual school system was unequal. The lawsuit held that Boston public school authorities had knowingly engaged

in a policy of racial discrimination. Further, the case revealed that the school system had intentionally maintained a segregated dual school system. In his 1974 ruling, Judge W. Arthur Garrity acknowledged the unconstitutionality of Boston school authorities' actions and required the parties to submit a plan for desegregating the school system. However, in the plan submitted, fewer than half of the students in the Boston School District were included, and those who were subject to the plan were painfully and unfairly affected.

Facts of the Case

After a finding that faculty and staff placements were also discriminatory, the First Circuit Court in Boston in *Morgan v. O'Bryant* (1982) ordered that African American and White teachers should be hired on a one-for-one basis until the percentage of African American faculty reached the 20% that reflected the direct proportion of the African American population in Massachusetts. This plan was to remain in effect until the school system achieved a 25% Black faculty total. A similar order was also applied to the school system's administration. The order imposed permanent faculty positions for African Americans in order to accomplish the desegregation goal. And, the permanent African American faculty numbers were proportionately tied to the general population of the area near an assigned school.

The *Morgan* order went further than many other desegregation rulings and set the stage for judicial review of the nature and scope of permissible desegregation remedies. Many other circuit courts had addressed these matters without creating permanent percentages of African American teachers and administrators. The First Circuit in Boston forthrightly defended its teacher percentages and preferential layoffs as necessary to ensure the rights of all students to a desegregated school system. In Boston, during 1971–1973, only 5.4% of the permanent teachers and 3.5% of the administrators were African American. The resulting court decisions and orders that followed were designed to eliminate desegregation in Boston by requiring certain percentages of African Americans throughout the school system.

As in other cities, numerous private organizations resisted the court's various orders designed to

compensate victims of a long history of pervasive discriminatory hiring in an assiduously maintained segregated school system. Therefore, the court consolidated all of its appeals to forever settle the issue of discriminatory hiring of faculty, staff, and administrators in the Boston school system. Since the school district had failed to comply with the recruitment percentage in 1978, the court then modified its orders to require that the percentage of African American teachers increase annually by at least one and one-half percentage points until the 20% goal was attained.

By early 1981, continued progress in desegregating the Boston school system was threatened by a budget crisis that triggered decreased funding for the school system. The Boston School Committee's effort to comply with its reduced budget focused on massive layoffs of teachers and administrators by reverse seniority. These layoffs under reverse seniority would drastically reduce the percentage of African American teachers and administrators hired in the previous few years, which, in turn, would violate the district court's desegregation orders. The school committee compromised by proposing that the layoffs of teachers be changed to ensure the current percentage of African American teachers was maintained—but insisted that layoffs of administrators must occur by reverse seniority.

After filing of motions, the district court decided to grant the motion maintaining the correct percentage of African American teachers with certain conditions but denied the motion requesting administrators be laid off in order of reverse seniority, since this would be a violation of court desegregation orders. Although the court did not mandate the layoffs, it did determine in what manner layoffs should be made. Consequently, layoffs took place in accordance with the priorities established in the court orders. Information provided by the Boston Association of School Administrators and Supervisors (BASAS) demonstrated that if seniority had been followed, 13.8% of African American administrators would remain. The Boston Teachers Union (BTU) brought an appeal asserting that the seniority approach should have been utilized and, although BTU did not do so related to the faculty percentage positions, it did argue against the need for any layoffs at all and against starting the layoff procedure while trying to increase the percentage of African American faculty in the school system.

The plaintiff class, the Boston school committee, the state board of education, and interveners *El Comité de Padres Pro Defensa de la Educación Bilingüe* and Concerned Black Educators of Boston (CBEB) participated as parties in the case but argued that the court's orders failed to go far enough to remedy past discrimination in the school system. The court used an analysis of *Milliken v. Bradley* (1977) (*Milliken II*) that established the standards for equitable remedies in school desegregation cases. In its decision, the court did not argue that the Boston School Committee's proposal for laying off teachers was unconstitutional discrimination, nor did the school committee request an evidentiary hearing. Also, BASAS made no argument that the district court's maintenance approach was unconstitutional with respect to the administrators. Finally, CBEB actually had filed no motions until after the district court's subsequent order was entered. There was no procedural reason for the court to reexamine the issue at all; however, because the case was so important and it would have such strong human impact, the court preferred to return to the merits of the controversy to which it had applied the *Milliken* standards.

The first *Milliken* requirement is that the remedy to desegregation be determined by the scope and relation of the constitutional violation. Here, the court found that the order was really directed at preserving a percentage of African American teachers and administrators. This presentation of a percentage of African American teachers and administrators was a critical ingredient in desegregating the school system and was directly related to the unconstitutional conditions of discriminatory hiring found to exist by the district court. The court had to rectify the prior violations in the constitutional rights of students, faculty, staff, and administration. Accordingly, it had produced orders for the school system that would work toward eradicating segregation in the school system. The district court stated that its policy intended to desegregate the faculty and administrative staff was but one step in the process of eradicating segregation in the Boston school system. BTU had never argued against this policy or the seniority layoffs that would occur as a result, but it did assert that desegregation had been accomplished and that the district court's powers in determining how layoffs were managed was overreaching. First,

there was no indication BTU had ever moved for the court to withdraw its control because the school system had obtained unitary status. Nor was there any proof that Boston's dual school system had been dismantled. Therefore, the district court retained authority and power to order policies and procedures correcting unconstitutional conditions.

The second *Milliken* requirement states that the court's order must be designed to be the most appropriate method in compensating the victims by placing them in the same position they would have been in had they not been discriminated against. BTU and BASAS contended the orders did not satisfy this requirement because they benefited African American teachers and administrators who had never been proven to be victims of hiring discrimination and therefore the district court lacked the legal authority to order compensation for African American teachers. The court rejected this argument by reiterating the argument it made when the 20% goal was originally decided and further opined that the crux of the case was the constitutional violation to Boston's public school children and not mainly discrimination against African American teachers.

Constitutionally, Boston's public school children had the right to learn in a school system free of discrimination against its employees. And the effects of a fully desegregated school system could not be accomplished unless discriminatory hiring processes were completely eliminated. The court emphasized the broader importance of African American students and their families fully participating in the community. It also acknowledged the value of African American teachers and administrators establishing role models for African American students that would encourage them to aspire to the highest ideals and positions. Thus the court, in its review, found its orders were properly curative and were designed with the intention to strengthen Boston public school children's rights and to enable them to become important functioning members of the community. The future of the children within the Boston school system was the real target of the school system reform effort.

Appellants reluctantly accepted the court's policy as sufficient but argued further that, even if these orders were merely curative, they constituted forbidden racial hiring preferences and were

therefore unconstitutional. The court promptly rejected that argument too, by reiterating that any remedy necessary to abolish intentional discrimination is a constitutionally valid means of curing the current effects of the past discrimination.

The court noted that it was limited in providing a remedy such that any remedy must be a reasonable process that clearly moved forward the desegregation of the school system. In reviewing its previous rulings made during this case, the district court found them sufficiently reasonable in safely ensuring a measured progression to total desegregation; ordering instantaneous desegregation without court supervision would likely have had catastrophic consequences. The court went on to say that its current order affecting faculty and administrative percentages during budget cuts was more lenient than the previous hiring goal of 25%. And the substantial costs associated with the layoffs were, in the district court's view, a product of the layoffs themselves, not of its orders.

Next, in applying the last prong of the *Milliken* test, the court took into account the interests of state and local authorities in managing their own affairs against what level of court interference was constitutionally permissible when local school authorities fail to fulfill their obligations to the community. The order under review was not one that resulted from heavy-handed and impermissible judicial action aimed at a local administrative body resisting court orders. Rather, the current crisis facing the school system was caused mainly by budget cuts. Therefore, the court saw no reason to reverse its decision, which continued to be constitutionally valid but simply required the school system to continue to comply with its previous order. BTU's final argument, contending the court erred in failing to hold an evidentiary hearing before granting the school committee's motion, was found to be without merit because BTU had not requested a hearing and the evidence that would have been presented was not new.

Impact of the Ruling

Nearly two decades after the Massachusetts district court ruled that the Boston public schools had racially discriminated against African Americans and maintained a dual school system in the initial

1974 *Morgan* case, the court addressed the layoff problem concerning teacher seniority again in *Morgan v. Burke* (1991). In this instance, the BTU appealed a 1990 final judgment of the district court, arguing this time that because the 10% hiring goal for other minorities had been met, the school system had reached a level of "maximum practical desegregation" even though the African American faculty and staff 25% goal had not been met. The partial desegregation achieved for minorities required, the BTU asserted, the court to do a fact-intensive examination. The examination results would be reversible only if the district court's findings were clearly erroneous.

In its review this time, the district court dealt with the specifics of (a) whether unitary status had been achieved in the hiring of faculty and administrative staff, despite the school system not achieving its goals; (b) whether the district court's involvement in the school board's hiring of faculty and staff needed to be a permanent one; and (c) whether the desegregation order, having achieved partial success (or partially unitary), was significant enough without having achieved desegregation for African Americans.

After careful analysis, the court reiterated that its orders would stand and were to be followed so that the reform lawfully demanded two decades earlier could be accomplished. No excuse or other rationalization would be acceptable to the court. Indeed, the court noted that not insisting that its orders to desegregate the school system be followed would be reneging on its 20-year-old obligation to carry out its prior decision to remove segregation from every facet of the school system. This order, like its earlier ones, faced continued resistance by some members of the Boston community. The court orders, then and now, were viewed by the White community as a court-imposed social construct rather than ensuring that those students served by the Boston school system receive the kind of public education to which they were constitutionally entitled.

Studies and data have found that court-ordered school desegregation achieved significant positive changes in the Boston public schools: in racial balance, in educational opportunity, and in the school environment. Although the first decade following the desegregation orders was characterized by some uncertainty and instability, subsequent

decades reveal the school system has evolved into one with a higher level of order, balance, and quality education. Court-ordered school desegregation ended up serving as a necessary means of ensuring the continued evolution of the Boston public schools.

New studies conducted by the Boston School System have introduced additional methods for improving the quality of education while still maintaining the city's diverse social milieu. In 2009, the Boston public schools exist in a different climate and are composed largely of minority groups. A recent census showed Boston's White population is slightly larger than that of its African American and other minorities. This means that most families who left the public school system sent their children to private schools. Consequently, the Boston public schools have changed their mission from one of serving underrepresented students to one of targeting low-income, disadvantaged groups who cannot afford private education, regardless of race or ethnicity.

During the past 15 years, courts outside of Boston have lifted desegregation orders in more than 100 school districts from Alabama to California. These courts have made their decisions after school districts convinced the courts they were making a good-faith effort—whether successful or not—to attain racial desegregation. In 2006, federal courts sided 36 times with districts seeking to remove their systems from judicial oversight. Federal courts stepping back from monitoring desegregation is due in part to employment issues in the cities where school districts argue they must address general job losses in their area instead of seeking to address past discrimination against underrepresented minorities.

MULTICULTURAL EDUCATION

Multicultural education is defined by James A. Banks as an idea or concept, a process, and an educational reform movement that assumes that all students—regardless of their gender, social class, and their racial, ethnic, and cultural backgrounds—should have an equal opportunity to learn in school. U.S. schools are increasingly more diverse than they were before the *Brown v. Board of Education*, *Topeka, Kansas*, U.S. Supreme Court decision in 1954. African American, Hispanic/Latino, Asian American, and Native American students make up 42% of the national public school population. African American students constitute a majority of the school population in several of the 20 largest urban school districts in the country.

Yet school children from diverse racial, ethnic, and linguistic backgrounds continue to experience unequal educational opportunities. The racial achievement gap between White students and African American students has remained stagnant. The average 12th-grade, low-income student from

an underrepresented group reads at the same level as the average eighth-grade, middle-class White student. African American scholars, educators, and parents have called for educational opportunities that are multicultural and equitable and incorporate culturally responsive curriculum and instructional methods, equitable assessment practices, and organizational structures that promote interaction across racial and ethnic lines and facilitate academic achievement for all students. This entry looks at how that idea evolved, how multicultural education works, what its critics have to say, and how it may develop in coming years.

Historical Development

When several urban school districts enacted policies to promote racial and ethnic diversity in the years before, during, and immediately after World War II, their efforts were known as “intercultural education.” Intercultural advocates in New York, Pittsburgh, Chicago, and Detroit produced curriculum materials on African American history and race relations and designed professional development programs and college courses to promote cultural pluralism and improve human relations.

In some city neighborhoods, such as Harlem, New York, and the Hill District in Pittsburgh, intercultural education was also linked with activism by African American parents and community organizations to hire more African American teachers, promote African American history and culture, and improve race relations through radio programs, films, art exhibits, and children’s literature. Characterized as “educating for democracy” during the war years, intercultural efforts contrasted the stated democratic ideals in the U.S. of freedom and equality of opportunity with the historical reality of ongoing discrimination for marginalized groups. These curriculum and staff development efforts were largely halted during the Cold War era, when intercultural courses were criticized as “subversive and un-American,” and several teacher union leaders who promoted intercultural education were subject to “Red-baiting.”

By the late 1960s, African American Studies programs sprang up in colleges and universities, and African American literature and African American history courses were instituted in selected high schools across the country. Community and

parent activists from Los Angeles to Brooklyn demanded more control over the content of the curriculum, more African American and Latino teachers and administrators, and more decision-making powers on local school boards.

Models and Approaches to Multicultural Education

By the 1970s, African American scholars such as James A. Banks, Carl Grant, and Geneva Gay began to develop sophisticated models to explain how multicultural education might transform K–12 school systems. Banks's conceptual model of multicultural education includes five interrelated dimensions:

1. *Content integration* refers to the extent to which teachers use examples and content from a variety of cultures and groups to illustrate key concepts in their subject area or discipline.
2. The *knowledge construction process* examines how teachers help students understand and investigate the implicit cultural assumptions, perspectives, and biases within a discipline and how the knowledge created reflects the positionality and lived reality of those who construct it.
3. *Prejudice reduction* describes the characteristics of students' racial and ethnic attitudes and strategies that can be used to reduce prejudice and develop more democratic attitudes.
4. An *equity pedagogy* examines how teachers modify their teaching in order to facilitate the academic achievement of students from diverse racial, cultural, and social class groups.
5. An *empowering school culture and social structure* examines grouping and labeling practices, participation in extracurricular activities, disproportionality in achievement, and the interaction of the staff and students across ethnic and racial lines to create a school culture that empowers students from diverse racial, ethnic, and cultural groups.

Carl Grant and Christine Sleeter's model identifies five different approaches that address human diversity in the schools:

1. *Teaching the exceptional and culturally different* aims to assimilate students of color into the cultural mainstream and existing social structure, equipping people of color with the knowledge and skills to achieve in schools and society.
2. A *human relations approach* aims to promote tolerance and acceptance, reduce stereotyping, and promote students' self-concepts.
3. *Single group studies* focus on the experiences, contributions, and concerns of distinct cultural, ethnic, gender, and social class groups to promote structural equality and recognition of the identified group (for example, African Americans and women).
4. *Multicultural education* promotes equal opportunity in schools, cultural pluralism, respect for diverse peoples, and support for power equity among groups.
5. *Multicultural social justice education*, which is rooted in social reconstructionism, aims to eliminate the oppression of one group by another, involve students in democratic decision making, and teach social action and empowerment skills.

Sonia Nieto's model, developed in the 1990s, defines *multicultural education* as comprehensive school reform that challenges and rejects racism and other forms of discrimination in schools and society and affirms the pluralism that students, their communities, and teachers reflect. Nieto advocates for multicultural education that is antiracist; is pervasive; provides a basic education; focuses on social justice in education; and incorporates critical pedagogy. Her model includes five levels that exhibit increasing awareness and commitment by educators that range from support of the status quo at the lowest level to the gradual inclusion of the histories and perspectives of a broader range of people and students' increasing involvement in the community. In Nieto's fifth and highest level of multicultural education, all students learn to speak a second language, everyone takes responsibility for challenging racism and discrimination, and the curriculum and instructional techniques are based on an understanding of social justice as central to education. While multiculturalists have developed

comprehensive theoretical models, Geneva Gay notes that a gap continues to exist between the theory and practice of multicultural education in U.S. schools.

From Theory to Practice

In practice, schools often adopt a “contributions” or “heroes and holidays” approach to multicultural education that adds some cultural content but fails to challenge the underlying mainstream cultural assumptions of the curriculum or address systematic societal inequities. For instance, high school English teachers might include a novel by Toni Morrison or middle school social studies teachers might add a unit on the civil rights movement. As Sonia Nieto suggests, however, multicultural education requires a deep commitment to social justice and equal access to resources—it is much more than just including some ethnic content and cultural sensitivity. One approach advocated by multiculturalists to create more equitable classrooms and schools is the implementation of pedagogy and leadership that is “culturally relevant” or “culturally appropriate.”

Gloria Ladson-Billings coined the term *culturally relevant pedagogy* in *The Dreamkeepers*, her now classic 1994 study of eight exemplary teachers of African American students. Most approaches to culturally relevant or culturally appropriate instruction described in the multicultural education literature not only utilize students’ cultures as a vehicle for learning, but also involve the development of a critical consciousness among students and faculty to challenge inequities in the larger society.

Critiques of Multicultural Education

Multicultural education has not been without its critics. Conservative critics have argued that multicultural education is divisive, lacks intellectual rigor, and does not address the real causes of underachievement by racial and ethnic groups. Sleeter notes that many of the conservative criticisms ignore the research and theory that multicultural education builds on, particularly anthropological and sociological work on cultural dissonance and knowledge construction conducted by scholars from underrepresented groups and

feminist and critical scholars. She concludes that conservative criticisms of multicultural education arise from the unease Whites in the United States feel about the future and reflect the efforts of the mainstream to pin its fears and anxieties on the threat of “diversity.”

Radical critics fault multicultural education for embracing individual mobility rather than collective advancement and structural equality. They argue that multicultural education reifies the cultural characteristics, symbols, perspectives, and affiliations of individuals from particular racial and ethnic groups and fails to acknowledge multiple and “hybrid” identities that can result when race, gender, and sexual orientation intersect. Radical critics contend that when multicultural education is framed around learning about other cultures and dispelling stereotypes, the larger issues of structural inequality are ignored. Multiculturalists have responded to these critiques by acknowledging the growing complexities of racial and cultural identity development and by developing a more explicit focus on critical theories that analyze how race and racism systematically structure inequalities in schools and society.

Future Trends and New Theoretical Approaches

Racial, ethnic, cultural, and religious diversity in the United States is projected to increase and become more varied in the foreseeable future. Our growing Latino population is no longer concentrated in Florida and the Southwest but is distributed throughout the United States in northeastern states like Massachusetts, midwestern cities like Chicago and Milwaukee, and southern states like South Carolina.

In addition, there are a growing number of mixed-race students throughout the country who claim a bicultural or multicultural identity and challenge our current understanding of racial categories. The 2000 census instruction to “mark one or more” races created the possibility of 63 racial categories and began to reveal the growth of this population.

Despite the continued diversity of the school-aged population, there has been an overwhelming trend in recent years toward school district resegregation, particularly in states in the Northeast

and Midwest. In 2006, roughly 3 in 10 (31%) African American and Hispanic students attended schools that were nearly all students from underrepresented groups. Researchers at University of California, Los Angeles's Civil Rights Project/*Proyecto Derechos Civiles* note that intensely segregated schools for African Americans and Latinos have particularly negative consequences, as these schools often have high concentrations of poverty and are linked to unequal resources and educational outcomes. The 2007 U.S. Supreme Court decision that struck down voluntary public school desegregation integration plans in Seattle and Louisville narrows the strategies that public schools can use to achieve or maintain racial diversity. The resegregation of U.S. schools affects all students, as research confirms that classroom diversity and informal interaction across racial and ethnic groups can positively influence all students' learning and civic outcomes and improve intergroup relations and mutual understanding.

As multicultural education has come of age as a field of study, scholars continue to develop and apply new theoretical approaches to analyze inequalities in schools such as critical race theory (CRT). CRT developed in critical legal studies in the 1980s in response to the inability of traditional civil rights legislation to uncover racial inequity and legal injustice. CRT acknowledges that racism is a normal, not aberrant or rare, fact of daily life in U.S. society, and that historically the interests of African Americans in gaining racial equality have been accommodated only when they have converged with the interests of powerful Whites (known as "interest convergence"). CRT scholars often use storytelling, narrative, and autobiography as a way to expose and challenge social constructions of race and make visible the distinctive experiences of people from underrepresented groups in order to create counternarratives to the dominant mainstream narratives.

Other researchers investigate and theorize approaches to multicultural education in global contexts. In the *Routledge International Companion to Multicultural Education*, James Banks and his colleagues from Canada, Britain, South Africa, Brazil, Israel, Palestine, Russia, Japan, India, Peru, China, and other countries push the boundaries of multicultural education beyond the "politics of recognition" in particular nation states to a global

conversation about justice and equality in a transnational arena. Case studies discuss how theory and research on curriculum reform, immigration and citizenship, and the education of ethnic and cultural groups are enacted in particular national contexts and the importance of all students developing cultural, national, and global identifications. Conceptions of multicultural education will continue to expand in the future as multiculturalists investigate and incorporate a broader set of equity concerns worldwide.

Many of the concerns debated in urban school districts 70 years ago remain on the multicultural agenda, including the need for more teachers from underrepresented groups, increased parent and community engagement in decision making, culturally responsive and appropriate curriculum that reflects the history, values, and cultural knowledge of students from diverse backgrounds, and preparation programs that would enable all educators to "teach and lead for diversity." With a current U.S. teaching force that is 87% White and middle class, the ongoing challenge remains: how to make the promise of multicultural education "real" in order to provide an education for all students that, as Carl Grant and Gloria Ladson-Billings advocate, promotes structural equality, affirms societal diversity, and achieves academic excellence for all students while preparing them to become active members of a democratic society.

N

NAACP LEGAL DEFENSE AND EDUCATIONAL FUND

The National Association of the Advancement of Colored People (NAACP) Legal Defense and Educational Fund, Inc. (LDF), was founded in 1940. Since its inception, the LDF has used advocacy and litigation in the context of education, voter protection, economic justice, and criminal justice to fight against racial inequalities, with the goal of helping to reinforce the preamble of the Declaration of Independence: “All men [and women] are created equal.”

Under the stewardship of Thurgood Marshall, the LDF’s first director-counsel, the LDF received a favorable decision from the U.S. Supreme Court, which struck down “separate but equal,” a doctrine stemming from *Plessy v. Ferguson* (1896), in elementary and secondary schools, in the landmark case of *Brown v. Board of Education, Topeka, Kansas* (1954). This entry looks at the organization and the lawsuits it has conducted in the area of school desegregation and other civil rights issues.

Education-Related Lawsuits

Marshall, who was appointed chief counsel for the NAACP, and other lawyers successfully litigated cases such as *Gaines v. University of Missouri Law School* (1938), *Sipuel v. Board of Regents* (1948), *Sweatt v. Painter* (1950), and *McLaurin v. University of Oklahoma* (1950). Their legal emphasis in these

cases was not to undermine the “separate-but-equal” clause resulting from the *Plessy v. Ferguson* but to force states to live up to the clause. The NAACP’s legal defense team turned its attention to attacking “separate but equal” in primary and secondary education in the 1950s, resulting in *Brown v. Board of Education*, the decision that prompted racial integration of primary and secondary schools.

With the Supreme Court’s ruling challenging the legality of “separate but equal,” the LDF continued to use litigation and advocacy to fight injustices in the context of education. For example, the LDF successfully impugned the majority-to-minority transfer program, a tool employed to promote school desegregation and racial diversification, in a Georgia school desegregation case, *Adams v. Bibb County Board of Education*. The LDF was able to keep the core element of this program intact.

As the dynamics of school systems and governance changed, the LDF used creative measures to ensure justice in the context of primary and secondary education. For example, when a school district in Lafayette Parish in Louisiana sought a declaration to end court supervision to ensure school desegregation in 2004, the LDF, working in tandem with local attorneys, convinced the court that ending judicial oversight would not be pragmatic. Instead, the court ordered the school to increase promulgation of school choice and transfer programs and to address disparities in the maintenance and infrastructure of predominantly African American schools. The LDF has also worked

collectively with other civil rights organizations to ensure that the pathway to equality for underrepresented groups—affirmative action—remained operable.

Other Causes of Action

The LDF has also used litigation and advocacy to fight racial injustices and inequalities in the criminal justice system, voter registration and housing processes, and employment discrimination. For example, the LDF won a new trial for Zachary Wilson, an African American sentenced to life in prison. In 1997, when it was revealed that the prosecutor in Wilson's case made a videotape urging prosecutors to eliminate potential African American jurors, the federal courts granted Wilson a new trial because of discrimination in the jury selection process.

Similarly, the LDF filed an *amicus curiae* (friend of the court) brief in the U.S. Court of Appeals for the Third Circuit to support Mumia Abu-Jamal's claim of racial discrimination in the selection of jurors of his 1982 trial for the shooting death of a police officer. The LDF's involvement in the criminal justice system transcends the cases of Wilson and Abu-Jamal. Their central goal is to ensure that underrepresented groups have a voice in decisions that critically affect the lives of other people in the criminal justice system.

The LDF has worked to renew the Voting Rights Act (VRA), which was enacted in 1965 to establish protection for African Americans and other underrepresented voters who were deliberately disenfranchised. In 2007, key provisions of this act were scheduled to expire. The LDF worked indefatigably to ensure that those essential provisions remained intact. The LDF also has worked to provide voter protection for citizens through litigation and grassroots movements.

The LDF has worked collectively with other legal organizations to ensure a sense of fairness and justice in public housing. Specifically, the LDF, along with the American Civil Liberties Union of Maryland and the law firm of Morgan Lewis and Bockius, successfully litigated a case against the Baltimore, Maryland, Department of Housing and Urban Development (HUD) for discriminatory housing practices. In 2005, the LDF was charged with leading the legal team to devise

an appropriate remedy for HUD's violation. The court decision had an immediate and positive impact on public housing residents in Baltimore.

The legal team of the LDF has also engaged in employment discrimination litigations on the behalf of underrepresented groups. Their 2005–2006 annual report outlines two such cases; one involved custodians of a New York City School and the other involved African Americans and Latino employers of the New York City Parks Department. The LDF became affiliated with these cases and succeeded in defending their clients.

Scholarship Program

Aside from their initiatives to help mitigate racial injustices and inequalities, the LDF has operated a scholarship program for African American undergraduate and law students since 1964. The LDF has awarded scholarships, totaling more than \$19 million, that have helped more than 4,200 men and women to pursue their educational and career goals. The contributions that these scholarship recipients have made and continue to make are phenomenal. Five members of the U.S. Congress were recipients of the LDF scholarships, as were 13% of all active African American federal judges. Past recipients also include more than 40 municipal and state judges, and 11 state senators or representatives. Former recipients continue to distinguish themselves with accomplishments in their chosen professions.

NATIONAL ALLIANCE OF BLACK SCHOOL EDUCATORS

The National Alliance of Black School Educators (NABSE) advocates for high-quality education for the school-age population in the United States. The organization was founded in 1973 by Dr. Charles D. Moody Sr. to address the professional needs of African American educators and to promote access to quality education for all students in the United States.

During the 1970s, a plethora of research promoted a deficit model that questioned the cognitive, social, and emotional ability of African American students to learn and function in society. Although the grand narrative presented in educational research highlighted the perceived shortcomings of African American children, Moody documented and disseminated a counter-narrative that began with his seminal research on school districts under the leadership of African American superintendents.

As his research progressed, Moody realized the need to form an organization to support the professional growth and development of African American superintendents. Fifteen of the participants from his study agreed to work with him to form such an organization, and in August 1971, the National Black Alliance of School Superintendents was formed.

This organization had a major impact on the research agenda for African American teachers and administrators and was awarded a grant from the U.S. Department of Health, Education, and Welfare's Office of Special Concerns of African-American Affairs to conduct research on 40 school districts that primarily serviced African American students. The impact of this research and the outreach efforts made on behalf of the newly formed alliance paved the way for the creation of a larger organization: the National Alliance of Black School Educators.

NABSE is dedicated to serving and meeting the academic needs of African American students and has established the following protocols to facilitate effective instructional and motivational classroom pedagogies:

- A coalition of professionals involved in the field of education
- A forum for the exchange of ideas and strategies to improve opportunities for African American educators and students
- Identification and development of African American professionals to assume leadership positions in education and influence public policy concerning the education of African Americans

The NABSE has also created the following framework to guide the organization in realizing their goals, including, but not limited to, professional development opportunities for teachers from underrepresented groups, collaboration around effective pedagogy and professional resources, and professional mentorship in policy development and advocacy.

Each year, the NABSE holds an annual conference that includes exhibits, awards, school tours, and scholarly sessions focused on issues that affect teaching and learning in the African American community. Each spring the organization also conducts a policy institute known as National Education Policy Institute and distributes newsletters to constituents, sponsors 10 commissions, and hosts public forums to share and debate information pertaining to education, policy, and accountability with African American students and teachers in mind.

NABSE has demonstrated its sustained commitment to advancing the educational rights of all students and professional growth of teachers by fostering collaborative relationships, creating spaces to disseminate and debate research, and creating and sharing resources to support African American teachers in their quest to educate our nation's children.

NATIONAL ASSOCIATION FOR EQUAL OPPORTUNITY IN HIGHER EDUCATION

The National Association for Equal Opportunity in Higher Education (NAFEO) is the umbrella organization of the nation's 2- and 4-year historically Black colleges and universities (HBCUs) and predominantly Black institutions (PBIs). Founded in 1969 by a group of HBCU presidents, NAFEO is "the voice for Blacks in higher education." This entry looks at its program and accomplishments.

Goals and Mission

NAFEO was founded to provide an international voice for HBCUs and PBIs; to place and maintain the issue of equal opportunity in higher education on the national agenda; to advocate policies, programs, and practices designed to preserve and enhance HBCUs and PBIs; and to increase the active participation of African Americans at every level in the formulation and implementation of policies and programs in U.S. higher education. Through its annual Presidential Peer Seminar and other professional development and networking opportunities, NAFEO trains and supports new cohorts of HBCU and PBI presidents.

Throughout its history, NAFEO has administered programs that provide services to its member institutions and their surrounding communities, with a specific focus on health issues (for example, obesity abatement, cancer prevention, and geriatric care), research in the science, technology, engineering, and math (STEM) fields, teacher education and training, and international education and globalization. Funded by the U.S. Department of Commerce, NAFEO's 2000 survey of technology capacity at its member institutions formed the basis of the Wireless and Technology Act of 2007 (now included in the Higher Education Act [HEA]). In 2008, NAFEO released a survey funded by the U.S. Department of Education of its members' foreign language, international studies, and study abroad capacity.

Since 1975, NAFEO has organized a National Conference on Blacks in Higher Education. NAFEO's convenings have been the nation's

premiere meetings on higher education equity and access. They have been virtual assemblies of "who's who" in U.S. educational, political, social, and *thought* leadership in higher education; the presidents and chancellors of the nation's HBCUs and PBIs; and federal and state policymakers and executives. NAFEO's convenings have attracted business, philanthropic, government, advocacy, civic, faith, and student leaders to exchange information about HBCUs in the United States, PBIs, and Blacks in higher education.

Each year during its national conference, NAFEO, through the Distinguished Alumni Awards, recognizes alumni of historically or predominantly Black colleges and universities who have distinguished themselves in their professions, their communities, our nation, or the world for excellence and altruism. In 2006, NAFEO launched two new recognition awards: the NAFEO NOBLE Prize and the Mays-Johnson Award. The NAFEO NOBLE Prize recognizes faculty members of historically or predominantly Black colleges and universities who are distinguished as teachers or researchers in at least 1 of 10 high-need or growth disciplines: the sciences, technology, engineering, mathematics, health professions, law, economics, foreign languages or foreign affairs, teacher education, and "peace, justice, equity or ecumenism." The annual Mays-Johnson Award salutes three currently serving NAFEO presidents or chancellors who possess the scholarship, self-determination, discipline, passion, professionalism, activism, fortitude, rectitude, creativity, collegiality, and faith personified by the nation's great African American college presidents.

NAFEO publishes three annual publications: *The State of America's Black Colleges*, *The State of Blacks in Higher Education*, and *Profiles of Member Institutions, Presidents, and Chancellors*. In 2008, *The State of America's Black Colleges* served as the basis for a full House Education and Labor Committee hearing on "America's Black Colleges and Universities: Models of Excellence and Challenges for the Future." The hearing marked the first time that the sole focus of a full committee hearing was concentrated on funding for HBCUs.

NAFEO's current president, Dr. Lezli Baskerville, is the association's fifth president and its first female president.

Accomplishments

NAFEO has played an integral role in shaping laws and policies that affect HBCUs and education excellence, equity, and access at the local, state, and federal levels, specifically regarding equal educational opportunity and affirmative action in higher education. Public investments in HBCUs made them comparable to and competitive with their historically White counterparts; college was made more affordable, and U.S. Black colleges were preserved and enhanced. During the 1970s, a number of lawsuits were filed against southern states, claiming that they continued to operate segregated systems of higher education. In 1973, NAFEO helped to negotiate the settlement in the landmark higher education desegregation case, *Adams v. Richardson cum Califano*. Since then, NAFEO has been a party or *amici* in the leading higher desegregation, diversity, and affirmative action cases.

In addition to its legal work, NAFEO has increased capacity at historically and predominantly Black colleges through its programs, academic competitions, internships, and faculty fellowships. NAFEO's student academic competitions include business plan competitions, writing competitions, and science and technology competitions, all of which have provided monetary scholarships to talented HBCU students.

In the aftermath of Hurricane Katrina, that devastated the Gulf Coast region on August 29, 2005, NAFEO provided emergency assistance to the HBCUs in the region by serving as the communication hub for Dillard University, Southern University at New Orleans, and Xavier University. Since the hurricane, NAFEO has continued to assist in ensuring that the affected institutions receive local, state, and federal funds to rebuild and restore their academic infrastructures and reputations. In 2006, NAFEO held a congressional field hearing in New Orleans during its annual conference to allow Black college presidents to testify about their rebuilding challenges before members of Congress. NAFEO also helped secure special budget reconciliation funds for the Katrina-ravaged HBCUs and to get various federal agencies to channel some of their existing funds to these institutions. Through a Ford Foundation grant, NAFEO established FACNet, a Web platform that allows faculty displaced by

Hurricane Katrina to connect online and to find research and funding opportunities.

In 2007, NAFEO was instrumental in drafting federal legislation to create an official category for PBIs. The Predominantly Black Institutions Act, a section of the HEA, authorizes grant programs to enhance the access of low-income, traditionally underserved African American students to higher education. Under the act, a Predominantly Black Institution is defined as an institution of higher education that is an "eligible institution" under the act with (a) a minimum of 1,000 undergraduate students, (b) an undergraduate population with at least 50% low-income individuals or first-generation college students, (c) an undergraduate population that is at least 40% African American, and (d) a student population of which at least 50% is made up of undergraduate students enrolled in an educational program leading to a bachelor's or associate's degree. In 2007, NAFEO also played a leading role in the Higher Education Act reauthorization, with the establishment of 10 Centers of Excellence in Teacher Education on HBCU campuses, expanding federal support for HBCU graduate and professional programs, and increasing the minimum Pell Grant authorization.

NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE (NAACP)

The National Association for the Advancement of Colored People (NAACP), the premier civil rights organization in the United States, was conceived in 1909 for the purpose of promoting equality of rights and the elimination of caste or racial prejudice. It is widely acknowledged for the leadership role it took in getting the U.S. courts to declare segregation unconstitutional. The NAACP now has 2,300 branches and 300,000 members, with headquarters in Baltimore, Maryland. It is indebted to so many whose dedication and commitment over many years made possible not only improved conditions for African Americans but also a better world for future generations. This legacy is the result of numberless, nameless individuals. This entry looks at the NAACP's historical background, with a special focus on its educational endeavors.

Historical Background

In 1908, race riots in Springfield, Illinois, so shocked William English Walling that he wrote an

article, "Race War in the North," published in the September 3 issue of the *Independent*. Moved by the atrocities committed by Whites against African American people, he closed with these words, "And what large and powerful body of citizens is ready to come to their aid?" This question became the first call for the formal organization that became the NAACP.

Mary White Ovington, a social worker in New York City, and Dr. Henry Moskowitz, who was prominent in the city administration of New York, joined Walling in searching for some solution to the challenge. They further enlisted the support of Oswald Garrison Villard, president of the *New York Evening Post* Company. He subsequently drafted what was to become known as "the Lincoln's Birthday Call," February 12, 1909, for a national conference on the "Negro" question. Some 60 citizens from all walks of life signed "the Call," and at a conference in 1910, the permanent body was organized, with W. E. B. Du Bois, the only African American attendee, elected director of publicity and research. This act brought the NAACP into contact with the Niagara Movement, which merged with the NAACP because of the similarity of their platforms and the inadequacy of its financial support.

The NAACP made clear its position on the scope of its purposes by stating that its concern was with public equality. The privileges of citizenship belong by right to all the people, inasmuch as the Constitution and the laws are for the protection of the minority and of the unpopular. To implement its purposes, the NAACP outlined a practical program that included conducting a scientific study of African American schools; organizing a Legal Redress Committee of national scope; establishing a bureau of information; publishing a monthly magazine, *The Crisis*; forming local groups known as branches; and making the organization known internationally.

Because the NAACP is primarily concerned with the denial of constitutional rights based on color, the conditions under which the association files a case are quite definite: Does the case involve color discrimination? Is some fundamental citizenship right of African American people involved? Early legal redress activities during the first three decades of the 20th century included a variety of cases involving discrimination. Through its major

local branches in Chicago, Boston, and Detroit, the association was successful in opposing anti-Black bills: discrimination in housing, employment, and access to public amusements and accommodations. The NAACP's most important work, however, was its vigilance in opposing hostile legislation in the Congress. It sought to prevent the passage of such discriminating legislation as antimarriage and residential segregation bills.

The association was also successful during this early period in winning decisions in the U.S. Supreme Court. In 1915, the Court, ruling that the grandfather clause was a mere evasion intended to disfranchise African American people, affirmed their right to vote under the Fifteenth Amendment. Two other significant victories were achieved in this early period: one in the area of housing and the other in relation to the Army. In 1917, the U.S. Supreme Court handed down a decision declaring unconstitutional a segregation housing ordinance that had been passed in Louisville, Kentucky. In 1919, under the leadership of Joel E. Spingarn, the association undertook to see that a provision was made for the training of African American soldiers to be officers in the Army.

Perhaps the most bitter and persistent fight by the NAACP was the one directed against lynching and mob violence. Steps for securing the enactment of a federal law were taken in 1919 under the secretaryship of James Weldon Johnson. Although neither the Dyer Anti-Lynching Bill nor any subsequent bill passed, the association's fight educated the public and awakened the national conscience to such an extent that lynching was reduced to a minimum. In addition, the association took positions and joined protests on any issues involving racism. It used its influence to protest the showing of the anti-Black film, *The Birth of a Nation*. Its concerns ranged from violence against African Americans in the armed services to opposition to the activities of the Ku Klux Klan. It cooperated with other organizations that were also seeking racial justice, joining the 1963 March on Washington.

Educational Programs

Because of the importance of education, the association concentrated a great deal of its efforts on the problem of school segregation. The association

was convinced that African American children who were denied an education would be at a disadvantage, not only for their personal advantage but also for their participation in a democracy. The fact that discrimination was widely practiced throughout the South—and in the North as well—the association's initial fight was with the public schools that wished to segregate according to race. It also extended its efforts on behalf of African American students who were seeking equality in higher education. These students encountered problems of housing, equal opportunity in participating in athletics and in practice teaching, as well as admittance to some graduate and professional schools.

A New Initiative

The NAACP through the years has fought many battles in the courts. Encouraged by decisive gains in the fight for equality, in 1939, it changed its legal procedure in education to a master plan for assault on segregation by seeking damages in federal courts. To put the plan into practice, the NAACP in 1940 organized as a separate corporation, the Legal Defense and Educational Fund, whose purposes are (a) to carry on a program of legal action within the courts to protect African Americans from discrimination because of race and (b) to destroy racial segregation by governmental agencies.

During the next few years, the association continued to oppose those who would deny African Americans equal educational opportunities. Despite the U.S. Supreme Court decision of 1938 establishing in the case of *Gaines v. the University of Missouri* the right to equality in publicly financed educational facilities, southern states continued to evade the Court's mandate. Therefore, in 1947, the NAACP initiated a program for the legal demolition of the entire structure of segregation in education. This was to be the master plan for assault on segregation: to demonstrate empirically the invalidity of the outmoded concept of "separate-but-equal" facilities.

To launch its full-scale attack against segregation, the NAACP filed cases contending that segregation itself in college and university facilities is discriminatory and violative of the Fourteenth Amendment to the U.S. Constitution and, accordingly,

unconstitutional and illegal. This frontal attack strategy, devised by Charles H. Houston, proved successful in two important cases in which the Supreme Court ruled in the NAACP's favor, making it possible for African American students to attend hitherto "lily-White" universities in the South. The two cases involved *Sweatt v. University of Texas* and *Sipuel v. University of Oklahoma*.

The Brown Decision

Having made inroads on discrimination in colleges and universities, the NAACP turned its attention to the secondary and elementary schools. The landmark case in this area was *Brown v. Board of Education*, argued before the Supreme Court by Thurgood Marshall, the lead counsel. *Brown* included four other cases filed at various times in four states and the District of Columbia and finally decided at one time on May 17, 1954, by the U.S. Supreme Court. This victory was the result of arguments based on the premises that segregation in public education violates and is forbidden by the equal protection clause of the Fourteenth Amendment and that the solution is not to order equalization of facilities but to assign pupils to schools regardless of race. The decision, while accepted by many states, was rejected by seven states in the Deep South, so that the Supreme Court's subsequent implementation decision of May 31, 1955, called for desegregation "with all deliberate speed."

The 1954 decision paved the way for many other achievements in the area of civil rights. The NAACP supported the civil rights movement of the 1960s through its legal staff and financial support. It provided leverage in the passage of the 1964 Civil Rights Act. Its 2000 voter mobilization efforts produced the largest African American participation in two decades. It has continued its historic work by launching the nationwide STOP! campaign aimed at halting defamation of African American women and denigration of the ancestors. The NAACP is committed to continue to press Congress for legislation for the common good.

The NAACP continues to award annually the Spingarn Medal, established in 1915 by Joel Spingarn, in recognition of the highest or noblest achievement by an African American during the preceding year or years. The NAACP continues its

unwavering pursuit of equal justice in every aspect of U.S. life until all vestiges of legalized racism in our society are eradicated.

NATIONAL ASSOCIATION OF TEACHERS IN COLORED SCHOOLS

The National Association of Teachers in Colored Schools (NATCS) was organized in 1904 as a professional education organization designed to represent the causes and issues of African American teachers and students. The purpose of the organization, as expressed in its constitution, was "to harmonize and unite the agencies now at work for the elevation of the African American people; to arouse a deeper educational interest among them; to encourage good citizenship; and to ascertain and publish statistics showing educational status." In 1937, NATCS was renamed the American Teachers Association (ATA), recognized as the largest African American educational organization in the United States; it existed for 62 years until it merged with the National Education Association (NEA) in 1966. This entry looks at the history of the organization.

Early Years

The association was founded by African American educator and civic leader John Robert Edward Lee, who was born enslaved in Seguin, Texas. He trained to teach at Bishop College in Marshall, Texas, served as dean of the Academic Department of Tuskegee Institute, and concluded his career as

president of Florida Agricultural and Mechanical College. In 1904, Lee called on African American teachers across the country to convene in Nashville, Tennessee, with the vision of organizing “a distinctive National Negro Education body” that would address the complex educational issues and disparities unique to teachers of African American youth. More than 125 teachers representing 14 states across the United States responded and attended the 3-day meeting, which concluded with a banquet at Fisk University. The conclusion of this meeting marked the birth of the National Association of Colored Teachers, for which Lee served as president for the first 5 years.

In 1907, at the association’s fourth annual meeting, the National Association of Colored Teachers was renamed the National Association of Teachers of Colored Schools to acknowledge that all teachers of African American youth were not necessarily African American teachers. In 1923, the association began to publish *The Colored Teacher*, later named *The Bulletin*, which served as the official organ of NATCS and provided a venue for discourse surrounding issues of interest and concern to African American educators. In addition to hosting conferences that provided teachers with supplementary training and professional development opportunities, the association also involved itself in efforts that resulted in legal, policy, and social change in education.

During its 62-year existence, the association was led and guided by many of the nation’s greatest African American educators, who were committed to racial justice, equality, and educational excellence. Notable former presidents include Mary McLeod Bethune, founder of Bethune-Cookman College in Florida, who served as the association’s first woman president in 1924; Mordecai Wyatt Johnson, former president of Howard University and association president in 1930; and Harper Councill Trenholm, former president of Alabama State University and association president in 1932. The dynamic leadership of these presidents, as well as many who served before and after them, coupled with the commitment of members who mobilized to fight for educational equity and racial justice helped build a legacy of excellence in African American education through a tradition of social consciousness and advocacy by the Black teacher.

Moving Toward Merger

At its annual meeting in Baltimore, Maryland, in 1934, NATCS adopted a Five-Point Program that declared its dedication

to the proposition that equal educational opportunities shall be provided for all the children of all the people of our great nation; it does not subscribe to separation in education or in any other phase of our common national interests, but it does recognize in certain sections of our country the actual existence of separation existed by law.

Until those laws changed, the following five points would need to be addressed: (1) equitable distribution of public tax funds regardless of race; (2) federal subsidy toward the equalization of educational opportunity for all regardless of race in states unable to provide sufficient funds for education; (3) a uniform salary and tenure schedule based solely upon training and experience, not race or gender; (4) issues of overcrowded conditions of African American schools, lack of adequate number of teachers, lack of sufficient buildings and equipment; and (5) inclusion of stories of African American life and history in school literature to develop an appreciation for African American life and contributions to civilization and exclusion of all material that gives an unfavorable impression of, or develops prejudice against, any race. Many of the organization’s accomplishments correspond to these issues, which are strikingly similar to the issues facing African American educators and students today.

By 1937, the renamed American Teachers Association (ATA) was the largest national organization of African American teachers. Before the 1960s, a large number of African American teachers, particularly those who worked in government-sanctioned segregated schools, were members of the association. As a national organization, the ATA sought to strengthen the efforts of individual teachers and smaller state associations by establishing a broader, more unified, and collective voice that would prove effective in championing the causes of African American students and teachers.

While documented accounts of African American teachers illustrate the marginalization of these teachers by the National Education Association

throughout the segregation era, the NATCS began to engage in conversations with its White counterpart as early as 1926 and collaboratively established the Joint Committee, which was charged with examining the lack of accreditation and evaluation of African American schools. While the Joint Committee worked to address the severe inequities and unfair treatment of African American teachers and their students, plans to unify the racially separate associations faced strong resistance for the next four decades. The ATA's merger with NEA in 1966 marked the end of an era for African American education, but the beginning of the participation of African American educators in prominent roles within the nation's largest education organization.

NATIONAL BLACK CHILD DEVELOPMENT INSTITUTE

The National Black Child Development Institute (NBCDI) was founded September 21, 1970, as a nonprofit organization that works to improve and protect the well-being of African American children. Over the past 37 years, NBCDI has maintained a legacy as the nation's forerunner in a multitude of innovative programs, workshops, annual conferences, and resources for African American children, their parents, and communities. As a national agency, NBCDI has four main program goals: child

health, child welfare, education, and public policy advocacy. The organization has made a major impact on child welfare services; it has contributed to making universal early care and education a reality; and it has consistently helped to build family support services for those in need.

The NBCDI takes a systems approach to child welfare. This perspective allows for the inclusion of parents, guardians, faith communities, social clubs, civic clubs, and all other members of society who deal with the mobilization of children. With this shared responsibility, NBCDI has thrived and grown into the well-respected agency that it is today. Based on this philosophy, the NBCDI has developed a number of programs designed to replace the "one-size-fits-all, deficit-oriented paradigm" with nurturance that serves children based on their strengths and needs. This entry looks at the institute's activities, with a focus on education-related initiatives.

Education Programs

The Love to Read program is an NBCDI national early literacy public education initiative designed to enhance the early literacy skills of African American children with the help of parents and other caregivers. The overarching goal is to improve African American children's academic performance through fostering a love and excitement for reading in children from birth to 6 years old. Scholars participating in research regarding this program highlighted the fact that the provision of a loving, rewarding, and nurturing environment is critical to the development of reading skills in children. They also noted that infancy is the ideal time to begin the conscious introduction of reading skills and word recognition activities to children. Researchers also cited cultural relevancy of the literature introduced to the children as an important variable in to the attainment of childhood literacy.

Spark-DC is another program of NBCDI developed to help communities prepare children ages 3 to 6 years old for the transition and rigors of school. An interesting aspect of Spark-DC is that it intentionally focuses on working to make *schools* ready for *children* through improving coordination and alignment of programs and services for young children. This far-reaching program benefits at least 1,000 children in Wards 1, 7, and 8 of Washington, D.C.

The Center on the Social and Emotional Foundations of Early Learning is another NBCDI program that has recently been relocated to Vanderbilt University in Nashville, Tennessee. This program is designed to improve the social and emotional outcomes and enhance school readiness in low income children from birth to 5 years old. The program includes research and information dissemination for Head Start programs and child care programs nationwide. This program also promotes the promotion of social and emotional development.

Entering the College Zone (ECZ) program was designed in 1995 to empower “at-risk” middle school students and their families by providing them with skills and resources to assist with their navigation through the process of applying to college. Funded by State Farm Insurance Companies, NBCDI has developed, in collaboration with the National Board of Professional Teaching Standards, an enhanced mentoring and tutoring component of the ECZ entitled Stepping Stones to College. The aim of this component is to specifically help eighth graders with high school transition and college preparation.

The Cross-Cultural Partnership Project is often nicknamed “the project.” This program provides an innovative alliance between the NBCDI and the National Council of La Raza (NCLR). The purpose of this program is to enhance, promote, and facilitate partnerships between the African American and Latino communities regarding early childhood education. The partnership is currently implemented in two cities and one state: Miami, Los Angeles, and New Jersey. These three locations are areas that have strong NBCDI and NCLR constituencies that have dynamically changed African American and Latino communities; these locations also have legislation of great importance directly related to the issues of quality early care and education.

Other Programs

The Spirit of Excellence Parent Empowerment Project (PEP) is a parent education program designed to educate, motivate, and inspire parents in their role as their child’s first teacher. A unique and empowering aspect of the program is that it was developed by and for lower-income African Americans and has been beneficial and effective with many parents. The PEP parenting education

curriculum includes affirmations, is parent driven, and requires active participation.

The African American Parents Project helps children cope with crises. This program provides parents with the information and resources they need to inspire hope and provide comfort and a sense of safety for their children. The main goals of the project are (1) to empower parents to recognize their role in children’s coping abilities; (2) to make parents more aware of the natural feelings and fear associated with traumatic experiences; and (3) to facilitate parent-child communication through the provision of age-appropriate tools. This program is a joint effort with the National Institute of Child Health (NICHD) of the National Institutes of Health (NIH). Other partners include 100 Black Men of America, Alpha Kappa Alpha Sorority, American Academy of Child Adolescent Psychiatry, American Psychiatric Association, Congress of National Black Churches, Delta Sigma Theta Sorority, Jack and Jill of America, National Association of Black Social Workers, National Coalition of 100 Black Women, and the National Medical Association.

The NBCDI has a strong contingency of volunteer affiliates spanning the nation. The volunteer affiliates consist of parents, professionals, and proletarians, who have demonstrated their allegiance to the NBCDI’s mission of “improving and protecting the quality of life of African American children and families.” These affiliates are located in various regions of the country, including Albany, Atlanta, Baton Rouge, Chicago, Des Moines, Detroit, Durham, Greensboro, Houston, Los Angeles, Miami, Mid Hudson (New York), Milwaukee, Montgomery County (Maryland), Nashville, New Orleans, New York City, Newark, Paramus (New Jersey), Pasadena, Pensacola, Pinellas, Pittsburgh, Sacramento, Seattle, St. Louis, Williamsburg (Virginia), and Williamsport (Pennsylvania).

The NBCDI’s annual conference culminates its yearly progress and is the premiere professional development conference for individuals sharing the goal of improving the lives of children, youth, and their families. Each year, the annual conference has brought together a multitude of educators, policymakers, administrators, parents, and early childhood professionals to participate in a

premium selection of workshops, seminars, lectures, and forums. Headquartered in Washington, D.C., the NBCDI, along with its multitude of programs, community-based initiatives, and advocacy on behalf of children, is a rare and powerful agency designed to enhance the opportunities for tomorrow's leaders. It has consistently proved itself dedicated to its mission and to the most valuable commodity of any community, its children.

NATIONAL COUNCIL FOR BLACK STUDIES

The National Council for Black Studies (NCBS) is the major professional organization of the discipline of African American Studies. Founded during the years when programs in African American Studies were proliferating at U.S. colleges and universities, the organization has set standards and goals and provided support for these programs and the scholars who belong to them. This entry provides an historical overview of the origin, development and accomplishments of NCBS.

Historical Background

The National Council for Black Studies formally began in 1976; however, its history began with a series of meetings and conferences that started in 1975. Along with laying the foundation for the organization, Dr. Bertha Maxwell Roddy became the organization's founding chair. As chair of the University of North Carolina's African American Studies department, Roddy put out a call to African American scholars throughout the United States to examine the importance of African American Studies.

In March 1975, the call was answered in the form of a conference. The initial conference was titled "The Black Studies National Conference for the Southeastern United States." The invited scholars included James Turner, Herman Thomas, Roscoe Brown, Curtis Porter, and Beverly Ford and Nick Aaron Ford. These scholars conducted research regarding the logistics of the discipline, and students from the University of North Carolina's African American Studies department presented position papers.

The students' papers debated the meaning of African American Studies and addressed the question of who should and should not be allowed to participate in the discipline. The students agreed that the research and curriculum should be conceived by, evaluated, and conducted by African Americans. Key needs that were identified at the first meeting included the following:

- Ways and means of evaluating programs
- Identification and description of models being used at various institutions
- Development of a communication network that would disseminate information about these programs

This meeting was the first of a series of discussions about beginning the organization. Subsequent meetings were supported by and held at the Institute of the Black World, the Association for the Study of African American Life and History Conference, and the Educational Testing Service. At a meeting in July 1975, the organization's name was created, core concepts were developed, and plans and proposals for the organization's mission were established.

The name "National Council for Black Studies" was officially adopted in 1976. The founding members of the organization include Carlos Broussard, William E. Pitts, William M. King, Valerie Edmunson, Andress Taylor, Bertha Maxwell, Ron McMillen, Andrew Goodrich, and Leonard Jeffries. The constitutional conference was held in April 1976. This meeting focused on the organization's constitution, the establishment of the executive board, and further discussion of the organization's mission. During this meeting, Bertha Maxwell and William M. King were appointed as chair and vice chair of the organization. The

NCBS slogan “Academic Excellence and Social Responsibility” was also adopted during the constitutional conference.

Activities and Achievements

NCBS held its first public conference in February 1977 at Ohio State University, with the theme “Black Studies: Mobilization for Survival.” From 1977 until the present, the annual conference has served as a forum for the dissemination of scholarship and a venue for mentoring students who wish to pursue a career in African American Studies. NCBS realized the need to formalize the study of the African world experience and to expand and strengthen academic units and community programs committed to the study of people of African descent.

The council’s commitment to academic excellence and social responsibility is reflected in its seven key objectives, which include (1) the facilitation and recruitment of Black scholars for all levels of teaching and research in universities and colleges through consultations and other services; (2) the creation and implementation of multicultural education programs and materials for K–12 schools and higher education institutions; (3) promotion of scholarly African-centered research on all aspects of the African World experience; (4) enhancement of informational resources on Pan African life and culture for the general public; (5) professional advice for policymakers in education, government, and community development; (6) international linkages among African American studies scholars; and (7) the empowerment of African people.

Along with the annual conference, NCBS’s commitment to the professional development and departmental support of its members is indicated in a series of events conducted by the organization. The Summer Institute is designed for African American studies scholars who are teaching or contemplating teaching in African American studies units. It creates opportunities to bring young scholars and senior scholars together in mentorship settings to explore cutting-edge intellectual issues in the discipline. The Administrative Institute is designed to orientate new African American Studies unit chairs and directors to the multifaceted nature of administering African

American studies units. The Administrative Institute also offers training in addressing administrative issues such as sexual harassment and affirmative action.

Opportunities for departmental support include the NCBS Civic and Community Education and Engagement Grants Program (CCEEGP). The CCEEGP provides grants to African American Studies professionals to implement programs in local communities that involve active engagement of faculty and students with community organizations and residents. NCBS also offers numerous student programs including the Ankh Maat Wedjau Honor Society, an annual student essay contest, and the Dr. Tsehloane C. Keto Student Leadership Development and Mentorship Program.

The council’s publications include *The International Journal of Africana Studies* (IJAS, formerly known as *The Afrocentric Scholar*), *The Black Women, Gender & Families/Women’s Studies and Black Studies Journal* (BWGF), and *The Voice of Black Studies*. The IJAS is published biannually and dedicated to scholarship and research about people of African descent. The BWGF is a collaborative effort between the National Council for Black Studies and the African American Studies and Research Program at the University of Illinois at Urbana-Champaign. BWGF, like IJAS, is peer reviewed and published biannually.

The Voice of Black Studies is the organization’s e-newsletter, which highlights the activities of the organization and its members and publishes employment opportunities in African American Studies. The NCBS Commission on Assessment, Program Review, and Accreditation has also played an active role in the development of meaningful and holistic African American Studies curriculum. The commission evaluates assessment practices, unit operations, faculty quality, student performance and attitudes, and African American Studies units’ contributions to their host institutions.

Under the direction of Dr. William Little in 1985, the organization’s National Curriculum Committee developed the Africana Studies Curriculum Model. This model establishes curricular standards for undergraduate programs and has informed educators regarding standards for K–12 and African American Studies graduate units. The National Council for Black Studies

commitment to Academic Excellence and Social Responsibility is exhibited in its various types of memberships, which is inclusive of those within and external to academia.

NATIONAL COUNCIL ON EDUCATING BLACK CHILDREN

The National Council on Educating Black Children (NCEBC) was founded by Augustus F. Hawkins, who served as California's first African American congressman from 1963 through 1991, chair of the Education and Labor Committee, and author of Title VII of the Civil Rights Act, which established the Equal Employment Opportunity Commission. Its ideological father was Ron Edmonds, whose work emphasized self-determination—the idea that the community could help reverse negative education trends if everyone played a role. This entry looks at its history and achievements.

Historical Background

In 1986, Congressman Hawkins gathered a coalition of 42 of the nation's African American educators and leaders and challenged them to develop a plan to advance the rigor and relevance of assessment and instruction for African American students and to prepare them to compete globally.

The result was the *Blueprint for Action*, based on the Effective Schools model of Dr. Edmonds,

director of the Center for Urban Studies at Harvard University, who had died in 1983. The *Blueprint* is now in its fourth edition and continues to show the “village” or stakeholders concerned with educating children how to empower and restructure low-performing school districts to deliver measurable positive results for all students.

The movement attracted strong organizational and corporate supporters and sponsors—the Urban League, National Association of Social Workers, Columbia University, the Congressional Black Caucus, Random House, and Delta Sigma Theta Sorority—to its first meeting. Since then, NCEBC has been advocating for education reform with actionable plans. The founders felt that solutions that help African American students help all students and pledged to incorporate the best theories and practices from education, particularly urban public education.

Theoretical Foundation

Edmonds and other researchers visited urban elementary schools in the 1970s and 1980s and found similarities in those that were successful at educating children from low-income households. Edmonds identified schools whose students and statistics refuted the popularly accepted views among educators, politicians, and the public that poor students could not learn and poor schools could not teach. Effective schools, he found, share the following characteristics or correlates: (a) have a principal who is a strong instructional leader; (b) provide a safe, community-like climate conducive for learning; (c) are staffed with professionals who have high expectations for all students; (d) provide a curriculum that relates to the experiences of the learners; and (e) maintain continuous evaluation, with remediation for mastery of content. In other words, the schools adapt to work for the students. According to Edmonds, educators knew more than enough about how to teach all children and had to determine why they had not applied the knowledge thus far and whether they were going to do so.

The *Blueprint* has solid methodology and measures for improving the education of African American students. More than 100,000 copies have been distributed. Key to the model is the

accountability of stakeholders. Each revision of the *Blueprint* embraces additional groups that have a vested interest in and responsibility for the mission. Stakeholders are students, superintendents, parents and family, teachers, administrators, paraprofessionals, support services providers (for example, psychologists, nurses), policymakers, higher-education leaders, business and community leaders, and religious communities.

The Blueprint stresses that stakeholders must assess their educational system, in part by identifying politics, policies, and practices that accelerate or impede educating African American children. They familiarize themselves with the text, then gather together to share ideas and take responsibility for goal setting, implementation, and monitoring results. Stakeholders commit to taking action on items that relate to their roles in shaping an effective school. At NCEBC annual conferences, stakeholders learn how to implement the *Blueprint*. They are encouraged to hold schools to standards higher than those articulated by legal mandates.

Actions within the *Blueprint* focus on children, African American children in particular. Special emphasis has been placed on males, since the Schott Foundation reported (2001–2002) that only 42% of African American males graduate from high school. It has been shown that oftentimes the expectations of public school systems, schools, administrators, and teachers are low for African American male students, and they are overcategorized as intellectually deficient.

The following are core values of NCEBC:

- The Village Takes Responsibility: All stakeholders in a community must be involved in improving teaching and learning.
- All stakeholders have a vested interest in the social, cultural, and intellectual development of all children, but especially those children who historically are on the bottom of the educational realm.
- All stakeholders must participate in implementing the research that shows evidence of fostering the growth in achievement of historically underserved populations.
- All stakeholders must examine the politics, practices, and policies in their communities that

accelerate or impede the academic performances of underrepresented children.

- Accountability must be community driven, with NCEBC stakeholders reviewing, monitoring, and collaborating with public and charter schools that receive local tax dollars.

Implementation and Outcomes

Several urban school districts have adopted the *Blueprint*. Baltimore County (Maryland) Public Schools (BCPS) superintendent Dr. Joe A. Hairston introduced the *Blueprint* to assess the district's performance. It formed the basis for the district's Master Plan. The Schott Foundation honored BCPS for having the highest graduation rate for African American male students of any large school district. In 2003, the Zion, Illinois, School District adopted *Blueprint III*. Washington State used the *Blueprint* as a resource in 1999.

School district representatives have had a presence within NCEBC since its inception. NCEBC maximizes its human, financial, and political resources by aligning with like-minded organizations. NCEBC has collaborated with the National Association of Black School Educators and National Black Child Development Institute. It has partnered with educational institutions (Howard University), grassroots community groups, political organizations (Congressional Black Caucus, Joint Center for Political Studies), churches, civic organizations (National Urban League), and professional organizations (National Association of Black Administrators, National Education Association). In 2006, NCEBC established a membership option.

The six NCEBC regional divisions—Mid-Atlantic, Midwest, Northeast, Southeast, Southwest, and Western—host local conferences, conduct research, and provide scholarships.

NATIONAL PAN-HELLENIC COUNCIL

Beginning with the formation of Alpha Phi Alpha Fraternity at Cornell University in 1906 and during the next two decades, African American students sought to find ways to make meaning of their college experiences outside of the classroom. For those attending predominantly White universities, fraternities and sororities provided a means for them to create a comfortable space in an often hostile environment. For students at Howard University, the historically Black institution where five of these groups were formed during this time, the fraternities offered an opportunity for students to play a role in the creation of extracurricular student life. For women at both Black and White institutions, sororities offered a haven in an overwhelmingly male environment. The National Pan-Hellenic Council is an organization of African American fraternities and sororities that promotes an exchange of information and cooperative programming and initiatives among these groups. This entry describes how the council was founded, how it evolved over the years, and its current condition.

Historical Background

The development of an umbrella body for African American fraternal organizations followed the same pattern of White groups, who began organizing at the beginning of the 20th century. In 1902, the Alpha Phi Sorority led an initiative to create a forum for sororities, and this meeting led to the formation of the National Pan-Hellenic Conference (NPC). Seven years later, 26 fraternities met to create a similar body, and by 1910, they formed the Interfraternity Conference.

By 1922, there were eight major African American fraternal organizations primarily located on college campuses. These small numbers led to the decision for all of the groups to meet together to investigate the creation of a coed umbrella organization. In that year, a meeting at Howard University in Washington, D.C., was convened from April 17 to April 19 to discuss mutual interests. That meeting did not yield a new organization, but it laid the foundation for the meetings that followed.

In 1928, during the national meeting of Kappa Alpha Psi Fraternity, held in Indianapolis, representatives from five organizations met to plan an umbrella organization. The representatives decided to share the results of the meeting with their respective members, leading to a follow-up meeting in 1929. At the 1929 meeting, the groups approved the formation of the National Pan-Hellenic Council as the umbrella organization for the African American fraternal organizations. This action was approved by the respective organizations, and the new group was officially founded on May 10, 1930.

Not all of the eight existing organizations were members at the time of the group's formation. The charter members of the NPHC included Kappa Alpha Psi fraternity, Omega Psi Phi fraternity, Alpha Kappa Alpha sorority, Delta Sigma Theta sorority, and Zeta Phi Beta sorority. In 1931, following ratification by their national conventions, Alpha Phi Alpha fraternity and Phi Beta Sigma fraternity joined the NPHC. In 1937, Sigma Gamma Rho sorority was the final member of the organization. The group decided that its purpose was to consider the issues of mutual concern for the members.

The early development of the NPHC was slow. On many college campuses, as the member organizations began to expand in the South and Southwest, students formed various pan-hellenic councils, officially affiliated with the new umbrella organization. This pattern on college campuses was symptomatic of issues in the larger organization.

Evolution

From the time the organization was formed in 1930 until the 1980s, little significant progress was made in advancing the causes of the member organizations. In fact, by all accounts, the NPHC was dead at the start of the 1980s. Dr. Michael V. W. Gordon, past vice-chancellor and dean of students at Indiana University, began a plan to assist the organization with the help of the university. Gordon's idea was for the institution to host the headquarters of the NPHC, providing a sense of stability that both the NPC and North American Intrafraternity Conference enjoyed. This proposal was met with skepticism by many members of the NPHC, some preferring a historically Black college as the host. However, Indiana University was the only institu-

tion that offered both physical and financial resources for this new venture.

It would take a decade for the organization to accept the office space at Indiana University. Under the leadership of Daisy Wood, who became the NPHC president in 1989, the organization was able to secure the space in 1992. Dr. Gordon—his time loaned by the university at no cost to the organization—served as the first executive director of the organization. Wood and Gordon set an aggressive agenda, which included clarifying the role of the organization to colleges and universities, maintaining an archive and records, and publishing research related to the African American fraternal experience. Beyond these specific goals, an overall mission was to expand the organization by creating councils on college campuses as well as in cities across the nation.

During the decades of inactivity, a ninth major African American fraternal organization, Iota Phi Theta fraternity, was founded at Morgan State University in Baltimore, Maryland, in 1963. Its earliest attempts to join the NPHC were rebuffed by the organization. In order to be viewed as a legitimate national fraternity, the organization joined the overwhelmingly White National Interfraternity Council. During her third term as president, beginning in 1995, Daisy Wood sought to rectify this situation and launched an effort to expand the membership of NPHC. By 1996, the expansion guidelines were set, and after a vote that fall, Iota Phi Theta became the ninth member of the council, officially approved on November 22, 1996. During the 1997 convention, the fraternity was formally installed as a member of the organization.

The first decade of the 21st century began a regression of sorts for the organization. The national headquarters space was lost at Indiana University as the university sought to make the organization self-sustaining, and the headquarters moved to a donated space in the international headquarters of Omega Psi Phi Fraternity in Atlanta during the summer of 2006. With the move, and the resignation in 2005 of the executive director, a doctoral student, after 6 years of service, the organization discontinued its executive director position, the salary of which had been paid by Indiana University. Many of the gains of the previous decade have been lost, and the

organization enters the new century struggling for a sense of identity and purpose.

NATIONAL URBAN LEAGUE

The National Urban League is an organization that seeks economic, political, and social empowerment for African Americans. It grew out of a need to assist African Americans who were suffering tremendously in a society where they were disadvantaged and disenfranchised. It was founded in the early 20th century as an interracial organization that would work to provide services directly to African Americans to combat the various social ills that they experienced in a racist society. Today, it has affiliates in 102 cities and 36 states, providing services to more than 2 million people across the United States.

Two key figures in the history of the organization were activist Ruth Standish Baldwin and educator Dr. George Edmund Haynes. Haynes held degrees from Fisk University, Yale University, and Columbia University and was the first African American to receive a doctorate from Columbia. Dedicated to aiding in the social welfare of others, he sought out ways to ameliorate the social ills plaguing African Americans. Haynes requested assistance from Ruth

Standish Baldwin, an organizer and chairman of the National League for the Protection of Colored Women. Baldwin was also the widow of railroad magnate William H. Baldwin Jr. She and her husband were philanthropists who supported Black colleges, including Tuskegee University, and championed social causes for underprivileged individuals.

Historical Context

Southern Whites used oppressive tactics in a Jim Crow system of segregation that was designed to subjugate African Americans. Lynching and violence were commonplace and were used as a means to threaten African Americans into submission. As a result of their circumstances, many African Americans migrated to the North. It soon became apparent that the challenges that these individuals faced as they sought jobs and a better quality of life needed to be addressed. At this time, many organizations were established that would directly serve these new northerners. These included the National League for the Protection of Colored Women, founded in 1905; the Committee for the Improvement of Industrial Conditions among African Americans, founded in 1906; and the Committee on Urban Conditions among African Americans, which was established in 1910. The merger of these three organizations resulted in the creation of the National League on Urban Conditions Among African Americans. This name would later be shortened to the National Urban League in 1920. The National Urban League is often referred to as the “Urban League” or “the League.”

The National Urban League originally aided northern African Americans whose migration to the North was still blighted by racial hostility. In spite of their hopes for improved conditions in the North, African Americans were still relegated by their low status in a society where they had limited access to education, jobs, and other resources that they needed to survive in urban cities. They found that these obstacles persisted even in northern states, where although racial attacks were less prevalent, opportunities were still very limited.

Early Agenda

The League focused much of its early programming on addressing the economic issues facing

African Americans by providing counseling, job training, and health services. This assistance was often coordinated through community centers, clinics, camps, and affiliated organizations. Professor Edwin R. A. Seligman of Columbia University led the League, along with Mrs. Baldwin and Dr. Haynes, during the early days between 1911 and 1918. Other early committee members included Felix Adler, Samuel H. Bishop, William H. Brooks, and Adam Clayton Powell. The organization began to systematically train social workers, and by 1918, they had offices in 30 cities with 81 staff members.

Dr. Eugene Kinckle Jones took over leadership of the National Urban League, succeeding Haynes in 1918. From 1918 to 1941, Jones directed the League and was instrumental in organizing boycotts against companies that refused to hire African Americans. The League began to systematically challenge racial segregation under the guidance of their new leader. Jones worked to consistently provide educational opportunities for youth by pushing schools to expand their vocational programs. He also pressured officials in Washington, D.C., to include African Americans in New Deal programs. He initiated the work to get African Americans included in previously segregated unions.

It was during his tenure that the National Urban League began to attack claims of the intellectual inferiority of African Americans through extensive research using scientific methods. Trained sociologist Dr. Charles S. Johnson became the director of research and investigation for the National Urban League in 1921. The League published a journal entitled *Opportunity: A Journal of Negro Life* from 1923 and 1949. The journal's motto was “Not Aims, but Opportunity,” and as editor, Johnson focused on using sociological studies with empirical data to dispel myths about African Americans. He was a great supporter of artistic talent, which was evidenced by his efforts to host an annual literature contest in an effort to encourage poets and writers to submit to the publication. The journal published various African American writers, including Gwendolyn Bennett, Langston Hughes, James Weldon Johnson, and Countee Cullen. Johnson became a key figure in the Harlem Renaissance as a result of his support of these literary giants through this publication.

The National Urban League continued to work with other organizations to address issues affecting

African Americans during the period of the Great Depression. In 1933, the League collaborated with the National Association for the Advancement of Colored People (NAACP) and other interracial organizations to form the Joint Committee on National Recovery (JCNR). The JCNR lobbied for African American relief and recovery programs in Washington, D.C. The League became increasingly concerned with advocating for African Americans through councils in cities around the country.

Lester B. Granger was appointed successor to Jones in 1941. He also fought for the integration of the racist trade unions that were in existence at that time. He developed the Industrial Relations Laboratory of the National Urban League. He continued to work toward increasing job opportunities for African Americans by working to integrate the numerous defense plants that were active during this period. Another facet of the League under Granger's leadership was the National Urban League Guild, which was directed by Mollie Moon. It was during this time that the League also began to work with other organizations to advocate for African American soldiers and to challenge the inherent racism that existed in the United States in spite of the participation of numerous African Americans in World War II. The League was one of many organizations to challenge then-president of the United States, Franklin Delano Roosevelt, in an open letter signed by leading officers of the NAACP, the Urban League, the National Council of Negro Women, and the African Methodist Episcopal Church.

The Civil Rights Era

Civil rights activist and social worker Whitney M. Young became one of the National Urban League's most famous leaders when he succeeded Lester B. Granger as executive director in 1961. This new leadership proved to be a commanding force in the civil and human rights movement during the 1960s. Under Young's leadership the organization helped coordinate two key events: the March on Washington in 1963 and the Poor People's Campaign in 1968. Young's leadership also included a vast expansion of the League with the increase of local chapters from 60 to 98, and the staff increased in size from 500 to 1,200. Monetary contributions to the League also increased. Whitney Young died tragically and unexpectedly when he drowned in March 1971 off the coast of Lagos, Nigeria.

Vernon Jordan, a civil rights attorney and executive director of the United Negro College Fund, was tapped to replace Young in 1972. Jordan led the League with an agenda aimed at implementing programs that would focus on health, housing, education, and job training. The League was long considered one of the more conservative organizations of African American advancement. But, in times of peril and war, the League would take various stands against social injustice.

For example, in 1972, under Jordan's leadership, the Urban League signed a joint declaration with the NAACP that demanded the end of the Vietnam War. Two new publications emerged under Jordan: a journal entitled *Urban League Review* and the development of an annual report entitled *The State of Black America*. *The State of Black America* has been released each year in January at a national press conference since 1976.

Ron Brown, an up-and-coming attorney who had long been a member of the National Urban League, was promoted by Vernon Jordan to several positions within the organization. Brown served as general counsel, the deputy executive director for Programs and Governmental Affairs, and the liaison to the League's Commerce and Industry Council. He would later leave his position at the League to become active in the Democratic political party.

Under Jordan's leadership, the National Urban League tripled its budget and raised significant corporate funds to hire additional employees. After delivering an address to the Fort Wayne Urban League, Vernon Jordan was shot in the back by a confessed White supremacist on May 29, 1980, in Fort Wayne, Indiana. This assassination attempt caused Jordan to be hospitalized, and the incident received national media attention when President Jimmy Carter visited Jordan during his convalescence. Jordan resigned from the League in 1981.

Recent Years

John E. Jacob succeeded Jordan as the president of the National Urban League in 1982. Jacob became concerned with ensuring the financial stability and viability of the League and developed a Permanent Development Fund for this purpose. He also established awards and programs in honor of Whitney Young, including the Whitney M. Young Jr.

Training Center; the Whitney M. Young Jr. Race Relations Program; and the Whitney M. Young Jr. Commemoration Ceremony. Many of these programs were created as a mechanism for recognizing the achievements and development of staff members and volunteers with the League and the individual efforts of members working to improve race relations. Under Jacob's leadership, the League highlighted important social justice issues affecting the lives of African Americans. Self-help programs were implemented that emphasized efforts to reduce teenage pregnancies, assist single parents, and increase voter registration.

The 1990s marked a significant change in the economic structure of U.S. society, and attorney Hugh B. Price became leader of the National Urban League during this period. Price's leadership began in 1994, and he worked to implement more policy-based initiatives to conduct research on urban issues. Through his efforts, the League began to create more scholarship opportunities and worked to assess additional ways to increase the academic achievement of African American youth. Price established the League's research and policy center, known as the National Urban League Institute for Opportunity and Equality. He also revived *Opportunity*, which became a magazine that disseminated the League's perspective on issues including affirmative action, education and youth development, and efforts to create an inclusive multiethnic democratic country. Price was also responsible for opening a new headquarters for the League on Wall Street in New York City.

Former New Orleans Mayor Marc H. Morial was appointed the League's eighth president and chief executive officer on May 15, 2003. Morial brought new energy to the National Urban League, with an emphasis on fund-raising. Within one year, Morial secured more than \$10 million in funding for the support of League programs. He also created a conference known as the Legislative Policy Conference with the title "NUL on the Hill."

Morial created a five-point agenda that emphasizes the following: (1) youth, (2) economic empowerment, (3) health and quality of life, (4) civic engagement and civil rights, and (5) racial justice. For this reason, he created a new form of analysis called the "Equality Index," to measure the disparities in urban communities as they relate to the

five areas. This index is included in the annual *The State of Black America* report. Based upon the findings from the annual reports and concerns for the African American community, Morial established the League's first Annual Legislative Policy Conference, which was held in Washington, D.C. Congressional lawmakers and League leaders met to discuss various issues that were affecting African Americans. Based upon this meeting, the formation of A Black Male Commission to create recommendations and programs for improving the social conditions of African American males occurred.

The State of Black America report published in 2007 noted the particular challenges faced by African American males in contemporary society. The report provided numerous recommendations for addressing the various social inequities that were pervasive within African American communities. The National Urban League has persisted for nearly 100 years in the United States as an economically stable and viable contingency poised to provide policy recommendations and solutions to address challenges that individuals experience in many urban communities. The legacy of this organization has most often rested in the hands of the capable and visionary leaders who were focused on addressing challenges. Under the current leadership, it appears that the League will continue to thrive for many years to come.

NATION OF ISLAM

Since the seventh century, Islamic culture has provided positive contributions to human efforts to expand knowledge. History records Muslims' notable mathematical, literary, and architectural contributions to the Western world. In fact, the West owes its numerical system to the Arabs. It is, therefore, not completely unexpected that an African American religious group, the Nation of Islam (hereinafter, "the Nation"), that was founded upon pseudo-Islamic principles, would have the education of its members as a primary objective.

The emphasis on education in the Nation began with the "scientific teachings"—a type of numerology—of the group's founder, W. Fard (Fard Muhammad), which was continued by his chief disciple, Elijah Poole (Elijah Muhammad). The latter codified the teachings of the former into catechisms entitled *Actual Facts* and *Student Enrollment*, which contained, among other things, basic mathematical "facts" about the Earth and the universe. As part of their initiation, adult members of the Nation were expected to be good students and to memorize the catechism. Prospective members of the Nation were not granted membership until they displayed the ability to read and write; they were required to prepare and submit a letter requesting admission to the Nation.

Formal education—that is, elementary and secondary education—played an intriguing role in the Nation's early history. During the early 1930s, when the Nation was in its nascent stage in Detroit, Michigan, Elijah Muhammad and other Nation officials were arrested on charges of contributing to the delinquency of minors. They refused to place the children of members of the Nation in Detroit's public school system; the children were participating in an educational program in the Nation's "University of Islam," which provided basic elementary and secondary educational instruction. Their arrests created an uproar in Detroit, but it was resolved when the State of

Michigan and the Detroit public school system granted accreditation to the Nation's school.

During the early 1940s, when Elijah Muhammad was arrested and served 4 years in prison for refusing to register for the World War II draft, his wife and leader of the Nation during his incarceration, Clara Muhammad, helped maintain and extend the Nation's operations, including Universities of Islam.

With the help of Malcolm X, who joined in the 1950s, the Nation increased the number of its congregations dramatically during the 1960s. In the early 1970s, more than 40 Universities of Islam were in operation; some of these schools operated curricula comparable to those of public schools, while others were weekend instructional programs.

Universities of Islam maintained a curriculum that included the following courses: the 3Rs (reading, writing, and arithmetic), English, speech, biological and chemical sciences, geography, world civilizations, African American History, arts, crafts, drilling, Arabic, and Islamic Studies—mainly Elijah Muhammad's principles and philosophies. Extra-curricular activities included sewing and jewelry making; school sports other than for physical fitness were shunned. Certain Universities of Islam followed a nearly year-round schedule, with classes lasting for approximately one-half day. Students wore uniforms reflecting a conservative dress code. These schools prepared students to enter college and to train in key fields that were open to African Americans during that era. For males, it was agriculture, business, and engineering; for females it was teaching, home economics, and nursing.

In 1975, when Elijah Muhammad died, his son Wallace D. (W. Deen) Muhammad assumed leadership of the Nation. The latter faced opposition for his effort to transform the Nation into a more orthodox Islamic religious group. In 1978, Louis Farrakhan, a longtime spokesperson for the Nation, split with W. Deen Muhammad, and the two headed up separate organizations: W. Deen Muhammad led the World Community of al-Islam in the West, while Farrakhan reconstituted a Nation of Islam group. Both leaders continued to emphasize the importance of education, and the two organizations continued to operate elementary and secondary educational institutions. The World Community of al-Islam in the West renamed its schools Sister Clara Muhammad schools, in honor

of W. Deen Muhammad's mother. The new Nation of Islam continued to refer to its schools as Universities of Islam.

During the first decade of the 21st century, W. Deen Mohammed's (he revised the spelling of his name) group reported that at least 18 Sister Clara Mohammed Schools were in operation, while Farrakhan's Nation of Islam reported that 11 Universities of Islam were operational.

NEGRO DIGEST

Negro Digest, which later changed its name to *Black World*, was one of the United States' most important literary outlets for African American critical, creative, and expressive thought over the course of four decades. It was the inaugural publication of African American businessman John H. Johnson's nascent publishing venture, Johnson Publications. Johnson began publishing *Negro Digest* in November 1942 and ceased publishing the magazine after November 1951. He resumed publication of *Negro Digest* in June 1961, changing the name to *Black World* in May 1970.

Thus, *Negro Digest/Black World* paralleled and stimulated two periods of extraordinary cultural flowering among African Americans. The first period was the Chicago Renaissance, an explosion

of cultural and creative activity in Chicago between 1930 and the early 1950s. Examples of the literary contributors to the Chicago Renaissance were Richard Wright, Arna Bontemps, Margaret Walker, Gwendolyn Brooks, and Willard Motley. The second period was the Black Arts and Black Consciousness movement of the 1960s and 1970s, including writers such as LeRoi Jones, Alice Walker, and August Wilson. This movement paralleled the development of the Black Power movement and extended into every area of cultural and artistic expression.

The noncommercial character of *Negro Digest/Black World*, which had almost no advertising revenue, became both its strength and its weakness. Although the magazine gained international prominence as an independent, critical, and innovative publication, it lacked sustainable popular appeal. When *Black World's* circulation declined in the mid-1970s, Johnson could not continue to support the magazine financially. The magazine permanently ended publication after April 1976. This entry looks at its history and contributions.

The First Period

Several factors influenced the content and form of *Negro Digest*. Johnson observed that serious information by and about African Americans was scattered and often invisible in the mainstream media. He also noticed that African Americans were eager to read consequential writing about the African American experience. Johnson modeled *Negro Digest* after the highly successful mainstream publication *Reader's Digest*. During the 1942 to 1951 period and similar to *Reader's Digest*, Johnson reprinted articles in condensed form from diverse publications but eventually reprinted articles in their entirety. He also included various special features and, over time, added more and more original articles.

Negro Digest became profitable and achieved sales of 150,000 per month before being eclipsed by *Ebony* magazine, which Johnson launched in 1945. Corporate America, in the midst of a maturing capitalism, was looking to expand its markets for consumer goods. One remedy was to pay greater attention to a growing but largely untapped African American consumer market. *Ebony*, a slick, picture-oriented, monthly publication that

Johnson modeled after *Look* and *Life* magazines, achieved greater mass appeal and became a fitting conduit for corporate advertisers. Thus, *Ebony* was assured of a strong revenue stream. *Negro Digest's* revenue, on the other hand, was based primarily on the price of the magazine. *Negro Digest/Black World* carried no advertising except for a few products sold by Johnson.

When Johnson explained his reasons for bringing the magazine back in the June 1961 issue of *Negro Digest*, he indicated an acute awareness of the magazine's past significance and emerging importance. Johnson noted the loyalty of *Negro Digest's* readership, describing his receipt of numerous inquiries about the magazine and noting the astonishing fact that many readers had continued to send in their subscription checks during the publishing hiatus. Moreover, Johnson noted the important role of *Negro Digest* during 1942 to 1951 as an outlet for well-known African American writers such as Richard Wright, Langston Hughes, Chester Himes, Gwendolyn Brooks, Roi Ottley, and Zora Neale Hurston.

A Revived Publication

Johnson also spoke of a new interest in 1961 about the "activities and aspirations" of African Americans. *Negro Digest*, he felt, was poised more than any other publication to become an outlet for examining these concerns. To accomplish this end, Johnson appointed Hoyt Fuller as the managing editor; Fuller would guide *Negro Digest* from 1961 until its end in 1976.

Fuller brought a wealth of knowledge and experience to his new editing job at *Negro Digest*, and under his direction, the publication became the leading literary outlet for the Black Arts and Black Consciousness movement of the 1960s and 1970s. Moreover, Fuller helped to nurture young writers through the Organization of Black American Culture (OBAC), which he founded, who would significantly contribute to the Black Arts and Black Consciousness movement. Most important, every major writer to emerge from this movement would publish in *Negro Digest/Black World*. For many, this publication provided the first noteworthy exposure as a writer.

Negro Digest/Black World accurately reflected the multilayered dimensions of the Black Arts

and Black Consciousness movement. There was expansive productivity in poetry, for which *Negro Digest/Black World* was a primary and notable outlet. The publication's list of outstanding established writers and talented, young, emerging writers was astounding. A few examples were Gwendolyn Brooks, Mari Evans, Nikki Giovanni, Angela Jackson, LeRoi Jones or Amiri Baraka, Keorapetse Kgotsile, Etheridge Knight, Don L. Lee (who later came to be known as Haki Madhubuti), Audre Lorde, Naomi Long Madgett, Dudley Randall, Sterling Plumpp, Ishmael Reed, Sonia Sanchez, Alice Walker, August Wilson, and Carolyn Rodgers.

Negro Digest/Black World also advanced the movement in African American fiction through its regular publication of short stories, plays, literary criticism, and historical and biographical descriptions of significant African American writers. Similarly, the publication led the way in chronicling and analyzing the movement in African American theater that was rapidly advancing across the country.

In short, *Negro Digest/Black World* came to define the parameters of the 1960s and 1970s Black Arts and Black Consciousness movement. Record, book, drama, and film reviews; special features; and interviews with creative intellectuals and political activists revealed an important and intense dialogue on the relationship between art and politics, including global, Pan African expressions in fiction, music, dance, and the visual and plastic arts. Fuller also promoted in *Negro Digest/Black World* an informed dialogue on African-centered historiography, social transformation, and anticolonial movements.

NEGRO HISTORY BULLETIN

The *Negro History Bulletin* was founded in October 1937 at the urging of Mary McLeod Bethune, president of the Association for the Study of Negro Life (later to be known as the Association for the Study of African American Life and History [ASALH]). It was the brainchild of Carter G. Woodson, often called the “father of Black history,” who had created the ASALH in 1915 to promote African American history. The last issue of the *Negro History Bulletin* was published in 2000, but it continues as the *Black History Bulletin*. This entry discusses its initial goals and its evolving content.

Founding Rationale

The *Bulletin* was not Woodson’s first foray into disseminating information chronicling African American participation in history. In 1916, the association published under his direction the *Journal of Negro History* (later known as *Journal of African American History*), which was limited in its readership and contributors to scholars, historians, and educators.

Later, he addressed the same goal by creating Negro History Week (now Black History Month) in February, which commemorates the birthdates of Frederick Douglass and Abraham Lincoln. With this celebration, it became apparent there remained a dearth of knowledge and resources available to eradicate the omissions in the history of achievements and accomplishments of African American people and materials to supplement the existing classroom curriculum. To counter this and to aid in meeting his goal to popularize the history and reach the masses with authentic historical information, Woodson created the *Negro History Bulletin*.

The *Bulletin*, a publication of ASALH, unlike ASALH’s *Journal of Negro History*, is not directed at academicians and historians. However, like the *Journal*, the *Bulletin* continues to address Woodson’s goal, to promote and disseminate information chronicling the impact of African American people in history. Negro History Week and the *Bulletin* aided in informing young people and the general public of the achievements and contributions of African American people in the building of the

United States. Woodson believed this knowledge would inculcate in young people a strong sense of identity and aid in their self-definition and refusal to be defined by others. Additionally, this would negate or counter any sense of inferiority resulting from the way in which African American culture was or was not presented. A knowledgeable African American person would be both inspired and empowered to continue the legacy.

Thus, the *Bulletin*’s targeted audience was elementary and secondary teachers, students, and the general reading public. Even though Woodson was the managing editor, there was a major female presence both as members of the editorial board and contributors to the publication. Initially, it was published 9 months of the year, excluding July, August, and September; the subscription rate allowed for a large audience: \$1 a year or 12¢ a copy. Orders for 5 or more for class or club use could be obtained for 45¢ a year. The popularity of the periodical is indicated by the growth in circulation and use; by February 1938 the number of copies printed had grown to 25,000; the initial size of 9½ x 12 inches had changed to a smaller size and looked like a journal, not a newspaper; and the 8-page length changed to 16 pages; but the rates remained affordable. By the 1980s, the subscription rate had risen to \$25 per year for institutions and \$16 a year for individuals.

Evolving Publication Content

The first issues of the *Bulletin* set the tone for the format and content of issues to follow. They presented informative and instructional materials focused on a specific topic for the month. They contained articles on historical events, profiles on memorable persons—known and unknown—(not always African American people, but those who made a positive impact to African American history) and their achievements for each month, notes on books as well as a book-of-the-month corner, African American celebrations, school and general news, and stories of ancient African American history. Included in those early issues were articles on Africa, enslavement, and the Civil War and profiles of such personages as William and Ellen Craft, Robert Gordon, Alexander Dumas (*pere*), Alexander Dumas (*fils*), Lemuel Haynes, and Alexander Pushkin.

A perusal of the historical coverage in the *Bulletin* points up the cultural diversity that attests to how inclusive Woodson was in his understanding of history. Contributors to the *Bulletin* presented materials to supplement existing lessons plans and textbooks within the *Bulletin*. These included a quiz covering the contents of the previous *Bulletin*, vocabulary, grammatical, writing, and reading comprehension exercises. An exercise in “The Negro Scoreboard” (a feature in the periodical) required readers to underline, underscore, circle, read aloud; to identify the where, why, when, what, and how; and to know a specific vocabulary to be sure the article could be understood.

Another exercise asked the readers to find the errors in a paragraph and then correct the sentences. Some artistic exercises were provided by Lois Mailou Jones (1905–1998), a world-renowned African American artist and teacher at Howard University. She provided pictures for coloring and patterns for masks to be cut out and worn and to make sculptures from bars of soap. Additionally, the *Bulletin* provided a tool whereby African American female teachers could exchange ideas regarding assignments and exercises that had proven successful and to seek instructional help for inclusion and further celebration of African American participation.

The *Bulletin* continues to have a variety of instructional materials; encourages teachers to contribute to student materials, lesson plans and programs; and educates African American community to the contributions that have been and are being made. The last issue of *The Negro History Bulletin* was published in 2000 with Volume 63 and resumed as *The Black History Bulletin* with Volume 64 in 2001. In spite of the name change, the volume numbers continue sequentially. According to the ASALH Web site,

[The *Bulletin*] is dedicated to enhancing teaching and learning in the areas of history. Its aim is to publish, generate, and disseminate peer-reviewed information about African Americans in U.S. history, the African Diaspora generally, and the peoples of Africa. Its purpose is to inform the knowledge base for the professional praxis of secondary educators through articles that are grounded in theory, yet supported by practice.

The aim and purpose of the *Bulletin* have changed very little since its inception. As in the earlier issues of the *Bulletin*, photographs of teachers, students, and events are accepted for inclusion.

NEW DEAL

The New Deal was a configuration of tentative, and temporary, programs designed to relieve abject poverty resulting from the Great Depression. At the time, the prevailing belief was that the market, and its self-correcting mechanisms, would render these programs obsolete. The New Deal was a loosely connected configuration of work relief programs primarily for working-age men. The programs included the Federal Emergency Relief Administration (FERA), Works Progress Administration (WPA), Public Works Administration (PWA), Civilian Conservation Corps (CCC), and the National Youth Administration (NYA). While education for African Americans was advanced through these programs, serving between 1.4 and 3.3 million people, education was secondary to work relief and assistance. This entry provides an overview of educational programs and a discussion of their impact on African Americans.

Program Overview

The 1920s ended with the October 1929 stock market crash, which prompted massive poverty,

unemployment, and human deprivation. By 1933, 25% of all workers and 50% of African Americans were unemployed; mortgages defaulted, banks failed, riots and strikes over wages increased, and consumer purchasing power declined as a result of supply-side economic strategies. This Great Depression prompted a federal response to poverty through work relief, which eventually exposed the massive illiteracy and inadequately skilled U.S. polity.

Education projects included school construction, renovation, literacy classes, vocational rehabilitation, training, nursery schools, correspondence classes, and educational radio programs. Within this context, education was job related, directed at the poor, and explicitly tied to desperately needed economic development.

WPA projects included manual labor in the form of construction of roads, schools, and other infrastructure projects, or the production and distribution of consumer goods. It specifically helped to build and rebuild schools and hire unemployed teachers. WPA offered educational programs in the form of worker education, nursery schools, vocational training, and parent education.

The CCC, a youth employment program in conservation, provided aid to families receiving relief by sending a portion of youths' salaries home. The program provided on-the-job training; however, it became clear that basic literacy was necessary. Because the program was residential, in addition to literacy classes, instruction in Latin, mathematics, history, and vocational skills were offered during leisure time. By 1937, each CCC camp had a school building. By 1939, nearly a third of participants were enrolled in classes for an average of 4 hours per week.

The NYA was designed to keep youth out of the labor market, thereby reducing competition for scarce jobs and lowering the unemployment rate. It created work-study programs at the high school and college levels. The NYA afforded students pursuing secondary and college education the opportunity to continue their studies by providing part-time employment on campus or on construction projects. The NYA served nearly 500,000 youth and provided prevocational services to unemployed out-of-school youth.

Help for African Americans

The New Deal programs exposed persistent African American poverty. Attention to abject poverty cast a wide net, and African Americans were captured, not by design, but by the pervasiveness of the problem in the United States. The issues of African Americans were illuminated because the nation was focused on problems of poverty and homelessness. Issues that plagued the African American community for years entered public discourse.

Many of the initiatives that benefited African Americans were not due to federal government institutional will, but rather to the discretion given to social program designers, social workers, and reformers who personally promoted social justice and equality. First Lady Eleanor Roosevelt, activist-educator Mary McLeod Bethune, Secretary of the Interior Harold Ickes, head of the NYA Aubrey Williams and others worked to ensure that the needs of African Americans were addressed. African American schools and colleges received larger federal appropriations, with specific attention given to southern Black colleges.

The NYA, with its explicit nondiscrimination policy, was especially beneficial to African American student education. The NYA paid African American and White students identical compensation, provided aid to nearly 120 Black colleges, and set aside funding for eligible African American students. Conversely, the CCC had difficulties serving the needs of African Americans, who made up only 10% of the racially segregated camps. Camps often were cancelled or moved due to local community pressure.

The New Deal programs were not coordinated with the newly developing Department of Education because they were embedded in employment and welfare relief. Like his contemporaries, Roosevelt believed that the federal government should not provide direct federal aid to public education and therefore omitted it from the New Deal. Roosevelt's lack of coordination with the Department of Education and exclusion of the newly formed National Education Association created tension between the education community and the federal government. The New Deal education initiatives were not institutionalized and therefore nonbinding on Roosevelt's successors. However, they paved the way for a national education agenda.

While many of these programs continued the long history of segregation and discrimination, administrative leniency and discretion provided opportunities to infuse social justice and redistribution to ease inequity. Therefore, in many ways, the New Deal was one of the first sustained federal social justice interventions for African Americans. This disjointed series of work relief, social welfare, and educational programs raised the issues of the underrepresented to the public discourse and exposed massive inequity and injustice.

NO CHILD LEFT BEHIND

Passed in 2001 during the George W. Bush administration, No Child Left Behind (NCLB) represents the most recent reauthorization of the original Elementary and Secondary Education Act of 1965 (ESEA). NCLB targets four areas: strengthening accountability for student results; enabling more state and local flexibility in the use of federal funds; supporting the use of federal funds on educational programs and intervention that have research based effectiveness; and providing parents and families with more school choice. Yet in order to understand NCLB, and in particular, its impact on African Americans, it is necessary to understand the background of this document. This entry begins with a brief overview of the

ESEA 1965 legislation, followed by an overview of the NCLB legislation. The entry concludes by considering the impact this law has had on African American students.

Origins and Goals of the ESEA

The desire to close the academic and perceived social gap between students living in poverty—who often were (and still are) underrepresented students, primarily African American and Latino and their White and middle-class counterparts—was the basis for the original ESEA legislation, specifically the Title I portion of the act. In his State of the Union address, President Lyndon Baines Johnson proclaimed his intent to end poverty in the United States. He had been in office for only a month following the assassination of his predecessor and former running mate, John F. Kennedy. In this address, President Johnson told listeners that he was declaring a war on poverty in the United States. He further warned that this undertaking would be lengthy and require the use of multiple weapons or strategies. One of the primary strategies selected by President Johnson to remedy poverty was through education, and out of this concern and commitment, the ESEA was born.

In what would become known to the world as the “Great Society” programs, President Johnson and his sympathizers wanted to address the growing widespread poverty found in various U.S. enclaves, particularly those located among underrepresented communities in large, urban centers. Not surprisingly, lower- and working-class African Americans were a primary group targeted by ESEA, as were the accompanying compensatory educational programs that resulted from the legislation.

While ESEA certainly was not the first instance of federal government intervention in the affairs of preK–12 education, at the time, the act reflected an unprecedented financial and symbolic commitment. ESEA 1965 authorized the federal government to allocate \$1 billion to address educational concerns at the preschool, elementary, secondary, and college and university levels. These concerns focused mainly on allocating funds for the creation of preschool programs (for example, Head

Start), supplementing state and local funds for schools that served low-income student populations; creating supplemental educational centers and regional educational labs in an effort to improve curriculum, train teachers, and provide support for economically and culturally different students; strengthening state educational agencies; and providing funding to colleges and universities and scholarships for promising and needy students.

No Child Left Behind: An Overview

Though focused on accountability, standards, and school choice, NCLB was not the first federal education initiative to focus on these areas. At differing degrees of intensity, *A Nation at Risk* (Ronald Reagan administration) and *Goals 2000* (Bill Clinton administration) advanced the need to implement standards-based education as a means of increasing accountability. Additionally, *America 2000* (George H. W. Bush administration), despite not getting passed through Congress, expressed the need to provide parents and families with more school choice options. Thus, rather than initiating a novel strategy for intervening on preK–12 education, it is more accurate to note that NCLB strengthened the already existing interest, role and presence of the federal government in these areas.

In light of these issues, the primary justification offered for the creation of NCLB was the need to close the longstanding achievement gap between preK–12 student populations who are poor and rich and those who are White and underrepresented. Here, concerns with equity were invoked in the argument that school systems engaged in a form of “soft bigotry” when not holding themselves accountable for ensuring that all students achieved at high levels. Consequently, NCLB requires that school districts hire only “highly qualified” teachers for all subject areas; with a provision that over time, existing veteran teachers must also show that they are highly qualified to teach. “Highly qualified” status rests on demonstrated competency in the subject area taught, including holding a full teaching certification, majoring in the subject taught, and/or passing a state subject/content area test.

Additionally, NCLB requires that states create and implement a series of subject area tests for students in Grades 3–12. It is expected that school districts will report both aggregate and disaggregated data on student performance, with the latter focused on several subcategories including race-ethnicity, class, language proficiency, and disability. On the basis of achievement goals set at the state level, school districts and schools must show that their entire student populations, as well as the subgroup populations, meet the achievement goals set by each state. School districts and schools meeting these goals achieve “Annual Yearly Progress,” or AYP. Those that fail to meet these goals—either at the level of total student population or for individual subgroup student populations—do not meet AYP and receive sanctions from the federal government, ranging from providing tutorial services for low-achieving students and paying for the transportation costs of sending low-achieving students to other schools chosen by parents and families to state takeover.

African Americans and No Child Left Behind

While NCLB is positioned as a policy devoted to ensuring all students will receive an excellent and equitable educational experience, it has simultaneously received harsh criticism. These critiques focus on a broad array of concerns that fundamentally threaten the degree to which the policy can meet one of its goals of better educating African American children. For instance, one critique suggests that the federal government has not funded NCLB at a level necessary to fully implement the legislation. This lack of funding punctuates concerns about the harmful economic effects facing schools that fail to meet AYP, particularly the fact that low-performing districts are required to allocate already limited funding to pay for outside, private student tutoring services and the costs incurred in transporting students to alternative “choice” schools. This loss of funds further diminishes school districts’ abilities to strengthen their own curriculum and instructional program and is more likely to severely affect those districts that have higher student populations who do not perform well on annual tests.

A related critique centers on long-standing concerns about the overreliance and use of high-stakes,

standardized testing—methods that have disproportionately had a negative impact on African American students. This criticism primarily points out that under such conditions, African American students often receive more “drill and kill” learning that focuses on concrete skill mastery that is devoid of context, meaning, and the cultivation of critical thinking abilities. This suggests that rather than receiving a rich and fuller curriculum, these students will receive only what is perceived as necessary to pass state tests. In this way, it is suggested that NCLB not only leaves African American students “behind” but also helps to sustain the ongoing inequity already present in the current United States preK–12 educational system.

OPEN ADMISSIONS

An open admissions policy at a college or university is a policy that provides broad access to students from many backgrounds without regard for academic preparedness for college. Historically, access to higher education was reserved for the privileged few. Admissions policies catered to young, wealthy, white males, closing doors on the poor, minorities, and academically underprepared students. With the advent of public universities, but particularly during the 1960s and 1970s, the admissions policies of most colleges and universities evolved into a variety of open access policies, including in some cases universal access to educational opportunities for underrepresented and low-income groups. However, since the 1970s, educational opportunity has become more restricted.

A two-tiered system of open admissions exists today. Two-year public institutions admit anyone with a high school diploma or its equivalent regardless of academic background. This first-tier educates over half of the U.S. undergraduate population. The 2-year institutions operate under the traditional definition of open admissions: nonselective, low-cost enrollment. The second tier involves conditional open admissions policies, such as those currently practiced in the University of California (UC) system and previously practiced in the City University of New York (CUNY) system in New York City, which sets some criteria for admissions. This entry looks at the evolution of open admissions and how it has affected African Americans.

Widening Access

The opportunity to achieve higher education has been a persistent and highly sought-after value in the educational history of African Americans. Yet the tradition of denied access marks a discrepancy between desired goals and achieved goals. Efforts to combat restricted access and admissions led to the founding of three Black colleges: Cheyney State College in Pennsylvania (1839), Lincoln University in Pennsylvania (1855), and Wilberforce University in Ohio (1856). These colleges espoused the policy of open admissions, permitting the enrollment of all students in an effort to provide a higher education for all African American youth.

Historically Black colleges and universities have a long history of providing open admissions to African American students. For over 125 years, Black colleges and universities have provided access to higher education for the overwhelming majority of African Americans. Disregarding customary admissions criteria and operating under open-door policies, these institutions have admitted all who could benefit from a higher education.

Public Institutions

On a national level, access to higher education broadened with the passage of the Morrill Acts of 1862 and 1890, which fostered access to public higher education through the opening of land grant institutions, publicly supported 4-year institutions that extended affordable higher education to an increased number of students. Open

admissions policies were also spurred by the passage of the GI Bill in 1944, giving veterans of World War II funds to attend college. Promoted by the President's Commission on Higher Education for American Democracy in 1947 and funded by the Higher Education Act and its amendments in 1965, open admissions set the stage for equalizing educational opportunities and aiding underrepresented groups.

In 1960, California implemented one of the first major open admissions programs in the United States. Under UC's open admissions system that varies according to the institutional level: The top 12% of high school graduating classes are eligible for UC centers, the upper third of students are guaranteed admission to the state colleges, and the remaining students, as long as they have a high school degree, may attend the state's 2-year public institutions.

CUNY implemented open admissions after the 1969 demands of a group of African American and Latino students closed the university. CUNY's open admissions policy guaranteed every New York City high school graduate a place at CUNY with free tuition. It permitted students who were in the top half of their high school class or who had average grades of 80 to enroll in CUNY's 4-year institutions, opening the doors for underrepresented students educated in lower-performing high schools.

Open admissions programs of the 1960s and 1970s created tremendous access to baccalaureate programs, under the auspices of the Civil Rights Act and affirmative action programs. Particularly in education, affirmative action policies required that active measures be taken to ensure that African Americans and other underrepresented groups enjoyed the same opportunities for school admissions, scholarships, and financial aid that had previously been provided only to Whites.

Retrenchment and Restrictions

The late 1970s ushered in a movement away from open admissions policies in general but an attack on affirmative action programs in general. In 1978, quota incentives in colleges and universities were challenged under *Regents of the University of California vs. Bakke*. The outcome of the case was that race could be used as a factor in admissions

when choosing a diverse student body but the use of quotas at these institutions was not permissible. *Bakke* laid the foundation for further attacks on access to higher education for African Americans and other underrepresented students.

Open admissions policies were criticized for weakening academic standards and institutional rigor. Colleges and universities were called on to uphold and tighten academic standards by eradicating open admissions policies. In response to the critics of open admissions, CUNY implemented multiple changes to its open admissions policy by instituting a tuition charge and making admission to 4-year colleges more difficult by requiring a rank in the top one third of the high school graduating class. This policy drastically reduced number of underrepresented students. By 1998, the trustees of the CUNY voted to restrict admission to 4-year institutions by requiring students to pass a series of tests for admission to a baccalaureate program.

While open admissions have attempted to redress the injustice suffered by African Americans and other ethnic groups and to distribute privilege, power, and dignity in a socially equitable manner, some efforts have been made to combat those gains. Despite opposition, however, open admissions have been arguably the nation's most ambitious attempt to expand college access.

P

PARENTS INVOLVED IN COMMUNITY SCHOOLS v. SEATTLE SCHOOL DISTRICT No. 1

The Supreme Court ruling in *Parents Involved in Community Schools v. Seattle School District No. 1* (2007) ended the use of race in student assignment programs intended to achieve desegregated schools. In the future, public school districts seeking to use race as a factor in school assignment or transfer decisions will have to show the merit of racial diversity and document that other methods to desegregate schools have failed. This entry addresses the background, facts, and impact of *Parents Involved in Community Schools v. Seattle School District No. 1*.

Historical Context

Since *Brown v Board of Education, Topeka, Kansas* (1954), the U.S. educational system has struggled to desegregate its schools. Although public schools were required to desegregate after *Brown*, residential neighborhoods still tended to be racially segregated. Given that the U.S. educational system uses the neighborhood school assignment model, neighborhood schools tend to reflect the racially segregated patterns of their neighborhoods.

Employing student assignment policies as a way to overcome the reality of residential segregation has been used by many districts. In the name of desegregation, districts developed school assignments plans

that focused on maintaining a racial composition that approximated the racial composition of the district, that was within a certain percentage of the racial composition of the district, or that gave specific limits on the maximum number of African American or White students allowed to enroll in one school (e.g., San Francisco, California; Arlington, Virginia, Dekalb, Illinois; and Boston and Lynn, Massachusetts). Once the racial balance was achieved, schools would not admit any students who would disrupt the racial balance, and in some cases, students were not allowed to transfer into schools if the transfer would tip the racial balance within the school.

As desegregation policies focused on African American students being admitted to White schools, it was often African American students who faced the burden of being bused to create a racial balance. However, in more recent years, White and African American students have been bused to alleviate the racial imbalance between schools (e.g., in Charlotte, North Carolina, and Savannah, Georgia). The pattern of using student assignment and busing to achieve desegregation stayed in place for several years.

Facts of the Case

The Seattle School District had an open high school assignment policy in which any student could apply for admission to any school within the district. However, when too many students wanted admission to a particular school, a tiebreaker was used to decide who would be admitted to the

school. Student race was one of the factors that could be used to determine admission to ensure that the racial balance of the school did not deviate from the set standard. Both Whites and African Americans could then be favored in any particular school.

A nonprofit group, Parents Involved in Community Schools, sued the Seattle School District contending that the racial tiebreaker violated the equal protection clause of the Fourteenth Amendment, the Civil Rights Act of 1964, and Washington state law. In 2001, the district court found that the tiebreaker system was narrowly tailored and did not violate the Fourteenth Amendment. On appeal, a circuit court panel reversed the initial ruling, but then it withdrew that ruling and sent the case to the Washington Supreme Court. The State Supreme Court held that the student assignment plan did not violate state law and sent the case back to the circuit court to review the federal aspects of the case.

Using the precedent set in *Regents of the University of California v. Bakke* (1978) and reaffirmed in *Grutter v. Bollinger* (2003) and *Gratz v. Bollinger* (2003), the circuit court upheld the original plan finding that the plan was a narrowly tailored method to achieve the interest of educational diversity by keeping Seattle schools desegregated. The case was then appealed to the U.S. Supreme Court.

The Supreme Court combined the Seattle case with another that had been forwarded on appeal. In 2001, the Jefferson County, Kentucky district was using a plan that classified students as Black or Other to make school assignments and to rule on school transfer requests. The plan was a consequence of the precursor district court ruling by Judge James F. Gordon in *Haycraft v. Board of Education of Louisville* (1973), which ordered the desegregation of one of the largest public school systems in the United States. *Meredith v. Jefferson County Board of Education* was filed in response to a parent, Crystal Meredith, whose child was assigned to a school that was a 45-minute bus ride away and denied a transfer request because the closest school had reached its racial balance. In 2003, the district court (and later the U.S. Court of Appeals) found that the plan was in effect narrowly tailored to serve the interest of the district.

Because both *Parents Involved in Community Schools Inc. v. Seattle School District I* and *Meredith v. Jefferson County Board of Education* involved the use of race in student assignment, the cases were decided together. In a 5–4 decision, four of the justices voted to uphold the lower court ruling while the five other justices felt that the plan was not tailored narrowly enough. The position of the Court was that because the plans involved racial classifications, they violated the equal protection clause, as they were not tailored narrowly enough. In this decision, the U.S. Supreme Court reversed the lower court judgments and concluded that using race as a measure to assign students to schools to prevent segregation violated the equal protection clause of the Fourteenth Amendment. Students' race can no longer be used to assign students to schools to prevent segregation.

Impact of the Ruling

Parents Involved in Community Schools Inc. v. Seattle School District I, *Meredith v. Jefferson County Board of Education*, and *Brown v. Board of Education* were all argued on the Fourteenth Amendment. What made *Parents Involved in Community Schools v. Seattle School District No. 1* different from *Brown v. Board of Education* (1954) was that the recent racial imbalance in schools did not result from state sanctioned de jure segregation, which had ended some 30 years earlier. Rather, the racial imbalance was the result of other forces, such as long-term resistance and, ultimately, ineffective methods to achieve a desegregated school system. In addition, unlike *Brown*, there was not a unanimous decision among the Supreme Court justices as in the Seattle case.

Over five decades after the *Brown* decision, the role of race-conscious decision making in U.S. public schools has been changed again. The Fourteenth Amendment was used to end segregation in public schools and may also be a catalyst in public school education heading toward greater segregation. As a consequence, schools may be headed toward greater segregation among students. In the future, public school districts seeking to use race as a factor in school assignment or transfer decisions will have to show the merit in racial diversity and document that other methods to desegregate schools have failed.

As long as achieving racial diversity in public schools remains an interest, school will need to look to nonracial ways to achieve this goal. Attention may now be turned to economic integration, which has been employed as a way to achieve both economic and racial diversity within schools. As this country continues in a state of de jure segregation, future endeavors will have to focus more on the issue of school quality and not just attempt to orchestrate a racial mix of students.

PASADENA CITY BOARD OF EDUCATION V. SPANGLER

In 1968, students and their parents filed a lawsuit in the U.S. District Court, Central District of California (district court), against the Pasadena City Board of Education (school board), Pasadena Unified School District (school district), and school officials, seeking injunctive relief from alleged unconstitutional segregation of schools in the school district. The school district created a plan in which no minority group was to be the majority in any school. In 1974, the school district asked the court to declare the segregation had been ended and to relinquish control over the schools. When the court refused, the school district appealed. In the end, the U.S. Supreme Court found on behalf of the school district, ruling that the plan approved by the trial court had achieved

the objective of creating a system of assignments to public schools on a nonracial basis. It held that the trial court exceeded its authority in requiring an annual readjustment of attendance zones so that there would not be a majority of minority students in any school. This entry explores the backdrop, the facts, and the impact of *Pasadena City Board of Education v. Spangler*.

Historical Background

Enslavement began in the United States when the English colonies settled in Virginia, and it remained legal until 1865, when the Thirteenth Amendment of the U.S. Constitution was ratified. Enslaved Africans were captured and sold to men buying and selling enslaved Africans. Enslavement existed in the United States from about the 17th to the 19th century. Important amendments were made to the Constitution of the United States: (a) Thirteenth Amendment (1865), abolishing enslavement and involuntary servitude; (b) Fourteenth Amendment (1868), guaranteeing citizens of the United States the right to life, liberty, property, and equal protection of the laws; and (c) Fifteenth Amendment (1870), guaranteeing citizens the right to vote.

In 1849, the first school desegregation lawsuit was filed in *Roberts v. City of Boston*. Deciding the case, the Massachusetts Supreme Court established the doctrine of separate-but-equal public schools. In 1896, in deciding *Plessy v. Ferguson*, the U.S. Supreme Court held the separate-but-equal doctrine was constitutional for all public facilities. This was the beginning of the Jim Crow laws designed to separate the races.

In 1954, in reversing *Plessy v. Ferguson*, the Supreme Court decided the landmark case *Brown v. Board of Education, Topeka, Kansas (Brown I)*, concluding that the doctrine of “separate but equal” has no place in public education because separate educational facilities are inherently unequal. In 1954, the Supreme Court also decided *Bolling v. Sharpe*. In that case, the Board of Education of the District of Columbia opened a new school and admitted only White students. Deciding the case, the U.S. Supreme Court ruled that maintaining a racially segregated public school by the states is unconstitutional and violates the equal protection clause of the Fourteenth Amendment.

and that maintaining racially segregated public schools by the District of Columbia, a federal governmental entity, is in violation of the due process clause of the Fifth Amendment.

About the same time, Arkansas Governor Orval Faubus called out the National Guard to prevent nine African American students from attending Little Rock Central High School. The students attended the school with the protection of federal troops. Later, the Little Rock School Board closed all public schools rather than desegregate the schools. Other school districts across the South also closed public schools to avoid school desegregation. In 1955, in *Brown v. Board of Education* (*Brown II*), the Supreme Court directed public school districts to move with all deliberate speed toward the desegregation of public schools. The Pasadena case reached the Supreme Court in 1968.

Facts of the Case

In 1968, students and their parents filed a complaint in the U.S. District Court seeking to stop the school district from discriminating on the basis of race. It charged the district with failing to adopt and implement a plan for the elimination of discriminatory practices. On January 23, 1970, the district court entered a decree, enjoining the school district from discriminating on the basis of race in the operation of the school district. The district court found the school district had adopted a neighborhood school policy and a policy against forced cross-town busing, both of which resulted in racial imbalance.

The district court concluded the policy violated the equal protection clause of the Fourteenth Amendment of the U.S. Constitution and entered judgment against the school district. The school district was ordered to submit a desegregation plan by February 16, 1970, to provide for the assignment of students beginning September of the 1970 to 1971 school year so that no school in the district would have a majority of any minority students. By order of court dated March 10, 1970, the district court approved the plan submitted, known as the Pasadena Plan.

In March of 1974, during a hearing, the district court found that five schools were, and remained, in violation of the no-majority-of-any-minority

provision. In 1974, the school district filed a motion requesting the district court to modify the 1970 order, dissolve the injunction, and relinquish jurisdiction. In the alternative, the school board requested the district court to modify the Pasadena Plan and adopt a freedom of choice plan, which would require additional busing. The district court denied the motion. On appeal, the court of appeals affirmed.

Because the case presented issues of importance regarding the authority of federal courts to impose a plan upon a school district designed to achieve a unitary school system, the U.S. Supreme Court granted certiorari. The Supreme Court ruled that the Pasadena Plan, adopted in 1970, had established a racially neutral system of student assignment. Therefore, the district court had exceeded its authority by enforcing an order requiring an annual readjustment of attendance zones, so there would be no majority of any minority in any Pasadena public school.

In addition, the Court found that the post-1971 shift in racial makeup of some of the schools was in no way related to any segregative action by the school district. Instead, the shift was caused by demographic changes in Pasadena's residential pattern, where the residents moved into, out of, and around the school system. The Court followed its decision in *Swann v. Charlotte-Mecklenburg Board of Education* (1971) in which it had held the following:

Neither school authorities nor district courts are constitutionally required to make year-by-year adjustments of the racial composition of student bodies once the affirmative duty to desegregate has been accomplished and racial discrimination through official action is eliminated from the system. This does not mean that federal courts are without power to deal with future problems; but in the absence of a showing that either the school authorities or some other agency of the State has deliberately attempted to fix or alter demographic patterns to affect the racial composition of the schools, further intervention by a district court should not be necessary. (402 U.S. at 1284)

Finally, the Supreme Court held that the no-majority-of-any-minority provision in the decree

was ambiguous, especially inasmuch as the parties interpreted the provisions differently than the district court. These two factors made a sufficiently compelling case that the district court should have modified the 1970 decree. The Supreme Court vacated the judgment, remanded the case to the court of appeals, and the court of appeals remanded it to the district court. On remand, the school district filed a motion to dissolve the injunction and to relinquish jurisdiction after nearly 10 years of court supervision, a motion which the district court denied. On appeal, the court of appeals vacated and remanded the case, directing the district court to enter a decree approving the Pasadena Plan of 1970, as modified, and to terminate the case.

Impact of the Ruling

In deciding the *Pasadena* case, the Supreme Court relied primarily upon *Swann v. Board of Education*. The Court has relied on its decision in the *Pasadena* case in deciding other school desegregation cases, as have lower federal courts.

A dual public school system and a unitary school system are distinguishable. The dual school system is based upon race, especially student attendance, in violation of the equal protection clause of the Fourteenth Amendment of the U.S. Constitution. In a unitary school system, there are no constitutional violations. In 1954, in the landmark case *Brown v. Board of Education (Brown I)*, the Supreme Court found a dual school system, and in 1955, in *Brown v. Board of Education (Brown II)*, the Supreme Court ordered the school district to move with all deliberate speed toward the desegregation of schools—that is, toward a unitary public school system.

The law requires the dismantling of a dual public school system. In seeking to dismantle what may appear to be a dual school system, a federal court must find convincing proof that school officials or some other state-related agency caused segregation in violation of the U.S. Constitution. Absent such convincing proof, federal courts have no basis for becoming involved or remaining involved in the school district.

In 1970, in *Pasadena*, the district court found convincing proof of constitutional violations in student assignments and therefore ordered the

school district to submit a plan to achieve racial neutrality in student attendance. The school district submitted what became known as the Pasadena Plan. A major provision of the Pasadena Plan was no majority of any minority students would enroll in a school in the school district. The objective of the plan was to establish a racially neutral system in student assignment.

Subsequent to 1971, there were shifts in the racial makeup of some of the schools because of changes in demographics of residential patterns. There were no subsequent constitutional violations by the school district. The district court required the school district to make year-by-year adjustments of the racial composition of the student body. In deciding the *Pasadena* case, the Supreme Court held that there had been no constitutional violations by the school district, and neither the district court nor the school district had a constitutional duty to make year-by-year adjustments of the racial composition of the student body.

In addition, the affirmative duty to desegregate had been achieved, and racial discrimination because of official action had been eliminated, the Court said. Finding the school district had attained unitary status after the 1st year, the Supreme Court concluded that the district court should have dissolved the injunction and relinquished jurisdiction. Instead, the district court made a lifetime commitment to the no-majority-of-any-minority provision in the plan. There was no evidence the school district or other public entity altered the demographics affecting the racial composition of the schools or otherwise violated the Constitution.

Further, a desegregation decree must not operate in perpetuity. There needs to be local control over the education of children, allowing citizens to participate in the process of decision making and innovation in order for the educational program to fit local needs. The basis for displacement of the duties and responsibilities of local authorities by an injunctive decree in a school desegregation case is a clear violation of the U.S. Constitution. In this case, any such violation had been corrected.

PHELPS STOKES FUND

The nonprofit Phelps Stokes Fund is the oldest continuously operating foundation in the United States serving the needs of African Americans, Native Americans, Africans, and the rural and urban poor. As stated on its Web site (<http://www.psfdc.org>), the fund's mission is as follows:

[To] address the educational needs of the urban and rural poor of Africa, the African Diaspora, and the United States with particular attention to the needs of people of color and Indians of the Americas. The Fund's activity is founded on the conviction that true education depends on a fundamental respect for human dignity, the development of the full capacities inherent in each human being, and the cultivation of social harmony.

As one of the first organizations in the United States to play a prominent role in transferring

models of education for African Americans and Native Americans, the fund influenced much of British colonial educational policy in Anglophone Africa in the early part of the 20th century. In addition to its education work, it was founded to provide funds toward tenement housing in New York City for the poor. Although it no longer is involved with issues of housing, the fund presents itself as an organization that seeks to build bridges of intercultural, interracial, and international understanding and uses its modest endowment to finance core staff and the operations of its central office in Washington, D.C. The fund operates with the support of private donors, foundations, and corporations and through grants from federal government agencies.

As of 2008, the fund's programs had focused primarily on serving as a National Programming Agency for the Department of State's International Visitor Leadership Program. It also has a few smaller active programs, including the Ralph Bunche Societies to encourage young college students from underrepresented groups to internationalize their academic careers. In April 2009, the fund officially changed its name to Phelps Stokes. It also has expanded beyond its original mission and target groups to include a program for recently released prisoners (homecomers) and leadership workshops for Afro-Colombian leaders (Programs for Latin American Countries). This entry explores the backdrop, the research, and additional accomplishments of the Phelps Stokes Fund.

Historical Background

The fund was incorporated in New York City in 1911, by the will of Caroline Phelps Stokes, one of the first female philanthropists in the United States. Stokes' concern for the needs of the underprivileged, women, and U.S. minority groups was deeply rooted in her strong Christian beliefs and was heavily influenced by her family's legacy in philanthropy.

On both sides of her paternal and maternal families, this legacy extended from the United States to Africa. Her maternal grandfather, Anson Greene Phelps Jr., was the president of the New York State Colonization Society and a member of the American Colonization Society, organizations which facilitated the back-to-Africa movement for

African Americans in the 1800s. Her paternal grandfather was a founder of the American Bible Society and the London Missionary Society.

Throughout their lives, Phelps Stokes and her sister, Olivia Egleston Phelps Stokes, engaged donors who supported causes related to education and health, particularly regarding African Americans, Native Americans, and the church. Even prior to the creation of the fund, these two unmarried sisters' activities and charitable contributions reflected their social and philanthropic interests.

From its inception, the fund used its \$800,000 endowment to establish funds and grants for educational and housing concerns. Its early educational philosophy was founded on the belief that African Americans should be peacefully assimilated into the national economy and society, namely, agricultural and vocational education. Although in contemporary times the fund's assumption may appear to be paternalistic and anachronistic, its proponents, such as Booker T. Washington, emphasized that the fund encouraged education—regardless of the type—for a population that traditionally had been prohibited from any form of formal learning.

The Slater Fund received the first education grant and helped to establish the Anna T. Jeanes Fund in 1911, which promoted rural and vocational teacher training in southern African American communities. Other early grants went to White scholars studying African American life at the Universities of Georgia and Virginia. Between 1911 and 1946, the fund provided over \$20,000 to African students studying in the United States. It also actively sought to bring Black South African leaders to the United States to study during the apartheid years under the Archbishop Desmond Tutu Southern Africa Refugee Scholarship Fund. By the 1950s, the fund had spent down its endowment and decreased its level of grant giving.

The fund had tremendous reach in colonial Africa, particularly given its small size. Of note is the fund's special relationship with Liberia, which began over 100 years ago. In fact, the first flag of Liberia was sewn in the family's home. Phelps Stokes's sister, O. E. Phelps Stokes, spent decades pushing for a Tuskegee-in-Africa, providing funds in her will to establish a Liberian vocational and industrial institution. Her wish was ultimately fulfilled when the

Booker Washington Agricultural and Industrial Institute was established there in 1929. Since these early activities of the Phelps Stokes family, the fund has attempted to maintain a presence in Liberia in contemporary times. As of 2009, however, the fund had no active programs there.

The fund was not without its critics, including W. E. B. Du Bois and Carter G. Woodson. Du Bois, in particular, felt that the fund's African education commissions propagated White hegemony. Du Bois, for example, established a cordial and respectful disagreement with Anson Phelps Stokes II, the first president of the fund. The African American scholar and activist disagreed with the fund's (and Washington's) stance that gradual attainment of education and wealth would lead to racial equality demanding instead full and immediate equality through political action and if required, physical resistance.

Despite its limited ability to serve as a grant-giving foundation and disagreements, the fund had a wide reach of influence. For example, it organized interracial retreats of African American and White educational and policy leaders at the famed Capahosic Conference Center in Virginia on such topics as the Montgomery student sit-in. It also was a leader in raising awareness and cooperation between Africa and the United States; for example, in 1954, the fund hosted a prominent luncheon for Liberian President William V. S. Tubman.

Research and Accomplishments

The Phelps Stokes Fund has initiated, conducted, and sponsored hallmark educational surveys and research studies that have been fundamental in shaping the improvement of education for African Americans, Native Americans, and Africans. Its first study, *Survey of Negro Education in the United States, 1913–1916*, published in 1917, was the first comprehensive study completed on African American education in the U.S. South. Other studies included *Education in Africa: A Study of West, South, and Equatorial Africa, 1920–1921* and *Education in East Africa: East, South and Central Africa, 1924–1925*, which established the blueprint for primary and secondary education for all of British Colonial Africa from the 1920s to the 1960s. The fund's first educational director, Thomas Jesse Jones, published *The Navajo Indian*

Problem in 1939. The fund also provided appropriations for *The Problem of Indian Administration* (also known as the Meriam Report), which informed President Franklin D. Roosevelt's decision to protect American Indian rights to exist as culturally unique peoples and to retain reservation land bases in their control.

In addition to these studies, the fund managed programs that furthered their interests, such as the African Student Aid Fund and Cooperative College Development Fund. From the Young Men's Christian Association (YMCA) to the American Bible Society, the fund also supported many nationally and internationally known programs and institutions through small grants and appropriations and provided advisory services when staff members served as board members or informal consultants to such organizations. For example, in 1935, A. Phelps Stokes II and the president of the Carnegie Corporation put forth matching grants to establish the South Africa Institute of Race Relations to support its work on interracial understanding. The fund also played an indirect role in many other notable organizations. For example, in 1950, President Frederick Patterson was a key player in establishing the United Negro College Fund (UNCF). Even though the fund was not directly involved in the founding of the UNCF, Patterson's advisory services and the fund's appropriation of small grants demonstrated its support of the new organization and its mission. The fund has played an historic role in incubating and contributing to other organizations in similar fashion, such as the Association of Black American Ambassadors, Boys Choir of Harlem, and the Jackie Robinson Foundation.

Past presidents of the fund have included A. Phelps Stokes II, Jackson Davis, Patterson, Franklin Williams, and Wilbert LeMelle. Its current president is Badi G. Foster. Educational directors and key commission members included Thomas Jesse Jones; Channing Tobias; and James Emman Kwegyir Aggrey, of Ghana.

Trustees included Claude Barnett (Associated Negro Press), Ralph J. Bunche (Nobel Peace Prize recipient), Rufus Clement (president, Atlanta University), Jackson Davis (General Education Board), James H. Dillard (the philanthropist and educator after whom Dillard University is named), Charles Loram (representative in South Africa),

Malcolm MacLean (president, Hampton Institute), Robert R. Moton (president, Tuskegee Institute), Rev. A. Phelps Stokes Jr. III (educator and clergyman), Isaac Newton Phelps Stokes (author and architect), Isaac Newton Phelps Stokes II (president of the Phelps Stokes Fund), Helen Phelps Stokes (widow of Anson Phelps Stokes I), O. E. Phelps Stokes (philanthropist who enhanced the endowment through contributions), and Richard West (southern Cheyenne Indian who directed the Smithsonian National Museum of the American Indian).

PHILANDER SMITH COLLEGE

Philander Smith College is a 4-year, historically Black liberal arts college in Little Rock, Arkansas, founded in the wake of the Civil War. It has grown and evolved over the years, meeting the various challenges of different historical periods, and continues to thrive. Its history is recalled in this entry.

Founding of the College

At the end of the Civil War in 1865, President Abraham Lincoln created the Freedmen's Bureau, which was designed to assist newly freed Africans in their acclimation to life in the United States. Around 1869, the bureau adopted a school at Wesley Chapel United Methodist Church, the oldest African

American Methodist Church in Arkansas. The church itself originated from what was known as the Little Rock African Mission, a vehicle by which enslaved Africans had church services led by White Methodist preachers who traveled to deliver the sermons. The Little Rock African Mission was formed in the late 1840s.

Around the time of the Freedmen's Bureau, early Methodists created a similar program known as the Freedman's Aid Society. The society, started in August 1866 in Cincinnati, was specifically designed to create schools in the South for the newly freed people. In Arkansas, the society assumed responsibility for the school at Wesley Chapel on November 7, 1877, and named it Walden Seminary after Dr. John Morgan Walden. Walden was the first corresponding secretary of the Freedman's Aid Society. Walden Seminary became the second institution founded by the Freedman's Aid Society west of the Mississippi River.

In 1882, Adeline Smith of Illinois, widow of Philander Smith, visited Little Rock with the intentions of providing funding for a local college. While visiting, she heard of Walden Seminary and knew that its purpose was consistent with the wishes of her husband regarding African American education, as he had a desire to fund the education of the newly emancipated. She made a donation of \$10,500 to Walden Seminary in his honor. On March 3, 1883, the board of the school voted to change the name of the seminary to Philander Smith College and chartered it as a 4-year institution.

Early Years

The first president of the new college was Dr. Thomas Mason, a White minister originally from Indiana. Mason arrived in 1881 to help reorganize the school, which was closed briefly that year due to financial hardships. He replaced Helen Perkins, who had served as the principal of the seminary. Perkins had previously served as president of another Methodist-related institution for Blacks, Wiley College.

During the initial years of the college, land was purchased for expansion. The first graduate was produced in 1888: R. C. Childers. Mason served until 1896, yielding to Dr. James Monroe Cox, the first African American president of the college. His

selection was important in the development of the College, as the first president and the majority of the faculty were White. Dr. John W. Hamilton of the Freedman's Aid Society noted that the appointment of Cox was indeed an experiment to determine if African Americans could be successful operating their own schools.

Cox, a graduate of Clark University (now known as Clark Atlanta University), was a professor of ancient languages at the college. Cox had the distinction of being the first graduate of Gammon Theological Seminary in Atlanta, a Methodist institution. He served on the faculty for 11 years before assuming the presidency. He continued the work of Mason by expanding the physical plant of the campus, most notably the acquisition of land on 10th and Izzard Streets. In addition to the plant expansion, Cox focused on the students and placed emphasis on their moral and religious development.

From 1924 to the Present

In 1924, Dr. George Taylor became the third president of Philander Smith College. Taylor was the first alumnus to serve his alma mater as president. Taylor was serving as dean of the college and had served as chair of mathematics prior to his assuming the presidency. When Taylor assumed office, the college, like most historically Black colleges and universities (HBCUs) during that time, offered courses for students from primary grades through college. Seeing the need for an accredited institution, Taylor began removing the primary and secondary programs from the campus. In his first year, the primary grades were eliminated. By 1936, his last year in office, the secondary grades were eliminated, which included Philander Smith High School. The college also acquired the assets of George Smith College in 1933 after it burned in 1925.

The next president, Dr. Marquis Lafayette Harris, had graduated from Clark College, where, as an undergraduate, he was a charter member of the Alpha Phi Alpha chapter. He continued his education, completing a degree at Gammon Seminary, Boston University, and completing a doctorate at Ohio State University. Prior to his presidency, he was on the faculty at Sam Houston College (now Huston-Tillotson University). Harris

has the distinction of being the youngest president in the history of the college, beginning his tenure at age 27, and is the second longest-serving president, leading the institution for 24 years, only bettered by the 28 years of Cox.

The Harris years marked a period when the college held the highest of academic standards. Students had to present a B average or better for admission with exceptions only for those who brought unique talents to the college. The college catalogue indicated that after the first 2 years of matriculation, each student was evaluated to determine if he or she had the ability to complete the rigorous program of study. It was expected that all students pursued postgraduate education.

Several critical events occurred during the tenure of Harris. Following the lead of Frederick Patterson, president of Tuskegee Institute, Philander Smith College became a charter member of the United Negro College Fund (UNCF) in 1944. However, the college was not eligible to receive any UNCF funding at the onset since it was not accredited. The UNCF agreed to hold the funds in escrow until the college was accredited. The college was fully accredited by the North Central Association of Colleges and Schools in 1949.

Harris continued the push for land acquisition; the college purchased the site of Little Rock Junior College in 1948, and by 1959, the college had added to its facilities new residence halls, a dining hall, and a student union. In 1952, the college received a \$10,000 gift from Bishop Edward G. Kelly for the scholarship fund. The college in turn named the president's house Kelly Hall.

Harris also sought to expand avenues of educational access for persons in the community. In 1941, he created the People's College with the purpose of educating community residents. There was no cost for those who studied consumer education, homemaking, general health problems, and creative living. By 1949, the college began offering night courses. Two additional historical firsts happened during the Harris years. Mary Jo Newburn received the bachelor of arts degree in art in spring 1952, becoming the first African American person in the state to receive that degree. In 1955, Dorothy Martin became the first White student in Arkansas to graduate from an HBCU.

During the 1960s as unrest in the country was mirrored on college campuses, the college saw several

leaders with shorter tenures. Dr. Roosevelt Crockett was the fifth president, taking office in 1961. Crockett was a 1939 graduate of the college and earned a doctorate from Boston University. During his 3-year tenure, the college completed the M. L. Harris Library and Fine Arts Center in 1962 and completed the Village Square Apartments, a public housing project, in 1963. He left the following year.

In 1965, Dr. Ernest Dixon led the college. He expanded the physical assets of the college, but served during a time of the greatest unrest, a time which included the assassination of Dr. Martin Luther King Jr. He left the college by 1969. During the Dixon administration, the college also grappled with the new realities of higher education. With the *Brown vs. Board of Education, Topeka, Kansas* (1954) decision opening up all higher-education institutions to people from underrepresented groups, specifically African Americans, the college saw its pool of applicants dwindle. The 1960s was also a decade of community college growth. Over the course of the decade, hundreds of schools opened up nationwide, focused on providing basic skill development for high school graduates.

A New Mission

In 1966, a faculty committee began to review the catalogue and reframe statements regarding the educational aims of the college. In particular, the new statements indicated the college would offer support for students needing assistance in developing their basic academic skills. This review continued into the administration of Dr. Walter Hazzard, a Methodist minister from Delaware, who became the president of the college in 1969. Hazzard was a graduate of Lane College, Crozier Seminary, with doctoral studies at Temple University. During his tenure, Hazzard added classrooms to the Harris Fine Arts Center and oversaw the construction of the Mabree-Kresge Science building, completed in 1979.

The new mission of the college was expressed in the 1971–1972 catalogue. The college noted that all schools were willing to educate the A and B student, but Philander Smith College was going to educate C students who struggle academically. By an evaluation of potential, the college was determined to educate students who simply needed a

fair chance. It was during this era that the college's mission shifted toward open admissions, a significant change in philosophy from the Harris administration that focused on quality students and high academic standards for admission.

Hazzard was followed by Dr. Grant Shockley, who became the third president of the previous four to serve a term of 4 years or less. Shockley was a graduate of Lincoln University in Pennsylvania, Union Seminary, with a doctorate from Columbia University. Shockley came to the college after serving as president of the Interdenominational Theological Seminar, also a UNCF institution, making him the only president with prior presidential experience.

The last two decades saw tremendous growth in the physical campus. In 1983, Dr. Hazo Carter began as the ninth president of the college. Carter is a graduate of Tennessee State University and completed a doctorate at Vanderbilt University. He came to the college after administrative duties in student affairs at Norfolk State University. Carter served only 4 years, but during that time, the teacher education program was approved. He left the college to serve as president of West Virginia State University.

Carter was succeeded by the third alumnus to become president, Dr. Myer Titus. Titus was a 1953 graduate of the college, having served the college as student body president as an undergraduate. Titus received his doctorate from the University of Missouri. One of the major initiatives was the Philander Smith Management Institute (PSMI). PSMI was created as a degree completion program, targeting adults who were less than 2 years away from receiving an undergraduate degree. Using a model that became popularized by for-profit universities, students entered cohorts that took classes in short intervals in a year-round program.

Great improvements were made to the campus infrastructure. During the Titus administration, the college added an academic building, named the Titus Academic Center, and a new gym named after Crawford Mims, a longtime administrator who had served as head basketball coach and vice president of academic affairs. The college added a business building and a physical education building.

Titus was followed by Dr. Trudie Kibbe Reed, who became the first woman president of the

institution in 1998. Reed was also the first African American president not to have graduated from a historically Black college, as she was a graduate of the University of Texas, with a doctorate from Columbia University. Reed came to the college after almost 20 years of experience at the headquarters of the United Methodist Church in Nashville, Tennessee. Reed sought to transform the physical campus completely with a \$15 million capital campaign that garnered over \$20 million.

Several key facilities were constructed during her 6-year tenure. The college received an \$8 million grant from the Donald W. Reynolds Foundation of Nevada to construct a library and technology center that opened in 2003. The Harry R. Kendall Foundation, affiliated with the United Methodist Church, awarded another grant near \$8 million for the construction of a health science mission center. This center was unique in that it would also house the Arkansas Conference of the United Methodist Church, presenting a very public link between the college and the church. Reed's experience at the United Methodist headquarters was key to this grant being funded.

Finally, the college made an effort to improve campus housing. Utilizing a privatized housing model, the college was able to replace and even increase the number of bed spaces on campus through the new housing facility that opened in the fall of 2003. Reed left the college in 2004 to become the second woman to lead Bethune-Cookman College.

The 21st Century

In October of 2004, the college selected Dr. Walter M. Kimbrough to serve as the 12th president. Kimbrough came to Philander Smith College from Albany State University where he served as vice president of student affairs. Kimbrough earned degrees from the University of Georgia, Miami University, and Georgia State University. Kimbrough's early study of the college revealed several weaknesses, and he sought to lead a renaissance of the college through the implementation some of the philosophies from the Harris administration.

The Renaissance Plan was introduced in 2006 with a strategic plan designed to develop a unique identity for the college and to attract a stronger

student body. The college began to examine all its operations to focus on key indicators including retention and graduation rates. In the fall of 2007, the college launched a social justice initiative as a unique identity. The mission of the college was changed to indicate a desire to produce academically accomplished students, grounded as advocates for social justice, determined to intentionally change the world for the better. With the new initiative, a new logo and tagline were introduced. Within the first 3 years of his administration, the college saw its retention rate increase, and the incoming student body profile that fared above the national averages for African American student high school grade point averages and ACT scores.

PLESSY V. FERGUSON

In its 1896 ruling in *Plessy v. Ferguson*, the U.S. Supreme Court rejected Homer Plessy's attack on the constitutionality of Louisiana's Separate Car Act, which required separate railroad cars for African Americans and Whites. The decision was

used to establish a constitutional rationale for segregation in the United States, where race determined what facilities a person could use, from washrooms and lunch counters to bus seats and even textbooks. The legacy of *Plessy* was the constitutional sanction of racial caste that went largely unchanged until *Brown v. Board of Education, Topeka, Kansas* (1954) when the Court finally accepted the position argued by Plessy's lawyers over 50 years earlier that forced segregation by race violated the core principles of the Fourteenth Amendment.

Historical Context

The struggle for racial justice that led to the case of *Plessy v. Ferguson* actually began a decade earlier, in 1876, in the conflict over the continuation of Reconstruction. The contested presidential election between Rutherford B. Hayes, the Republican candidate, and Samuel Tilden, his Democratic rival, presented stark contrasts over how African Americans would be treated in the aftermath of this contest. The "radical" Republicans had initiated Reconstruction in the South, which had transformed the status of African Americans from that of enslaved African to one of free citizen. But the Democrats were determined to preserve vestiges of racial caste that had been customary since the period of enslavement and sought to diminish federal presence in the South. This election and its impact on race and Southern politics set the stage for the issues that the Supreme Court would later address in *Plessy*. This case not only would usher in the legal era of "separate but equal," but also would accelerate the social, economic, and political marginalization of African Americans in the South into a system of apartheid that would last for over 50 years.

In 1876, more than the presidency was at stake; the revolutionary U.S. experiment with equality was hanging in the balance. Although enslavement officially ended in 1865 with the passage of the Thirteenth Amendment, this was not enough to end a system of subordination that had become an integral part of every aspect of Southern life. The challenge in the aftermath of the Civil War was how to make the promises of freedom to the 6 million newly freed Africans a reality rather than a

mere declaration of law. White resistance made it soon apparent that if the civil rights of African Americans were left to the respective states, Southerners would simply ignore those laws or resist them wherever possible.

Congress responded to these conditions with the passage of the Fourteenth Amendment in 1868. In its sweeping language, it declared as follows:

No state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any state deprive any person of life, liberty or property without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws. (Article XIV, Sect. 1).

Although African Americans made amazing progress in the short life of Reconstruction, by 1876, many Northern politicians had tired of “supporting the Negro,” and discrimination against African Americans was almost as rampant in the North as it was in the South. As White Southerners gradually regained political power from the Republicans and their African American allies, they became bolder and more ingenious in their efforts to resist the social economic and political changes that the amendment promised. African American aspirations were also met by increasing violence during this period. The formation of White Leagues, the Ku Klux Klan, and White militias ushered in a period of intense efforts to stifle the political power briefly held by African Americans during reconstruction.

New Orleans, Louisiana, became one of the battlefronts in this struggle where in 1874 pitched racial battles were fought in the streets that resulted in 40 deaths and over 100 wounded. Racial conflict intensified over the presidential election when violent resistance to African American suffrage resulted in the shifting of several Southern state electoral votes from the Republicans to now favor Tilden. With a tie in the electoral college, a commission was appointed to resolve the impasse. Tensions ran high, and there was even movement in some Southern states to send armed militia to Washington, D.C., to back their candidate. But backroom maneuvering by the commission proved successful in defusing the conflict and Southern

Democratic congressmen agreed to swing their votes to the Republican Hayes for president in exchange for his promise to withdraw federal troops from the South. With the exit of federal authorities in 1878, Reconstruction effectively came to an end and the rollback of African American rights began in earnest. It was against this backdrop that the stage was set for the constitutional drama that became *Plessy v. Ferguson*.

Facts of the Case

With the end of Reconstruction, Louisiana, like many states, began passing laws that required segregation in a number of public venues. Their efforts were supported when in 1883 the Supreme Court held that the Civil Rights Act of 1875, which barred discrimination in a variety of public accommodations, was unconstitutional. Although that case limited Congress’s authority to proscribe private acts of discrimination, Louisiana next targeted horse-drawn trolley cars and railroads as the focus of new segregation laws.

The Louisiana statute that became the subject of the *Plessy* case was passed in 1890 and required equal-but-separate accommodations for African Americans and Whites in trains running in Louisiana. Violating the statute was a crime punishable by fines ranging from \$100 to \$500. The law not only punished African Americans and Whites for sitting in a car not designated for their race but also provided for fines against conductors or other train personnel and even the railroad company if they failed to enforce the separation law. The law did grant an exception for a conductor who might mistakenly seat an African American person in a White car because of the person’s light complexion. The other exception was for colored nurses or servants who routinely accompanied White children in their charge in the “Whites-only” car. Although in theory the same rules applied to White nurses, as a practical matter this version of equal application of the law had little meaning.

These separation laws quickly drew opposition from a number of African American civic organizations in New Orleans. Editorials decried this effort to demean African Americans, so an African American organization decided to challenge the law in court. A Citizens Committee to Test the Constitutionality of the Separate Car Law was

formed around the leadership of Louis Martinet, a prominent Creole in New Orleans. Under his leadership, the committee eventually raised nearly \$3,000 and pledged to fight the case to the end. To conduct the litigation, they hired Albion W. Tourgee, a prominent lawyer living in New York who was known to be friendly to the cause of African American equality and who agreed to take the case without fee.

A Legal Challenge

The committee held a number of meetings to determine the best strategy to challenge the law. However, their first effort was cut short by the Louisiana State Supreme Court. In a case titled *State ex rel. Abbot v. Hicks* (1892), the court held that a conductor's conviction for seating an African American man in a White car was invalid because the African American passenger had boarded the train in Texas and that made his trip one of interstate commerce, which only Congress could regulate. The Citizens Committee had arranged for one of their group to get arrested traveling from Mobile to New Orleans, but with this new ruling, they correctly reasoned that charges against their man would be dismissed.

Finally, in July of 1892, Plessy, a Creole of one-eighth African American blood boarded a train within the state and was arrested for taking a seat in the White's only car. His arrest was carefully planned so that the constitutionality of the separate cars law could be challenged on its face. The committee's plan from the beginning was not simply to gain some advantage in the application of the local law, but to strike at the very heart of this rising tide of racial hostility by having all such laws forcing segregation declared unconstitutional.

The case went from a local police court, where Plessy was convicted and fined, to the Louisiana State Supreme court, which framed the issues that would eventually be addressed by the U.S. Supreme Court. Although Plessy's lawyers made a number of arguments, the court distilled them down to these issues of law. Did the separate-car statute violate the Thirteenth Amendment by imposing a badge of enslavement on African Americans? Did the law violate the rights to the equal protection of the laws guaranteed by the Fourteenth Amendment by forcing segregation by race even though the

accommodations were equal? Finally, did the law vest the railroad personnel with authority to decide who was White and who was African American, an authority that *Plessy* argued could be carried out only by a court?

The State Supreme Court denied each of *Plessy's* claims and offered a hint of the long shadow that this case would cast on African Americans in the future. The state court said that if *Plessy* could successfully argue that forced legal separation in railcars was unconstitutional, then all such laws, including the forced separation in public schools, would similarly be brought into question. This possibility, they argued, was not supported by legal precedent, and despite *Plessy's* argument that the Fourteenth Amendment fundamentally changed the legal status of African Americans, it was not one the court was willing to entertain.

The Supreme Court Rules

When the case reached the U.S. Supreme Court, the issues were essentially the same as those addressed by Louisiana's highest court. The opinion was written by Justice Henry Billings Brown. He first addressed *Plessy's* Thirteenth Amendment argument, that the separate car act was a badge of slavery. The Court responded that this was a complete misreading of the amendment. Brown wrote that while the Thirteenth Amendment clearly outlawed involuntary servitude and chattel bondage,

[a] statute which implies merely a legal distinction between the white and colored races—a distinction which is founded in the color of the two races, and which must always exist so long as white men are distinguished from the other race by color—has no tendency to destroy the legal equality of the two races, or reestablish a state of involuntary servitude. . . . It would be running the slavery question into the ground, to make it apply to every act of discrimination which a person may see fit to make as to . . . the people he will take into his coach or cab or car, or admit to his concert or theater, or deal with in other matters of intercourse or business. (163 U.S. at 543)

The Court similarly dismissed *Plessy's* claim that Plessy had a property interest in not having his race decided arbitrarily.

The Court then addressed *Plessy's* Fourteenth Amendment arguments. They conceded that the Fourteenth Amendment required equality before the law for both African Americans and Whites. However, again citing the civil rights cases, this formal equality could not eliminate the natural distinctions between African Americans and Whites, which may be taken into account by the states. He declared that political equality for African Americans was protected, but integrating public transportation was a claim for social equality, which the amendment was never intended to support:

So far, then, as a conflict with the fourteenth amendment is concerned, the case reduces itself to the question whether the statute of Louisiana is a reasonable regulation. . . . In determining the question of reasonableness, it (the state of Louisiana) is at liberty to act with reference to the established usages, customs, and traditions of the people, and with a view to the promotion of their comfort, and the preservation of the public peace and good order. (163 U.S. at 550)

Brown then argued that these separate car laws are no different than separate school laws that were upheld by state courts as early as 1850 in *Roberts v. City of Boston* and were currently maintained in the District of Columbia. This not-so-subtle reminder was offered to point out that the version of equality that *Plessy* argued for was not even practiced in the North where the amendment originated.

The obstacle that *Plessy* had to overcome was not simply in the interpretation of the statute that *Plessy* urged, for history would 50 years later vindicate his legal theory, but he faced the prevailing notion of the time, that African Americans were inferior to Whites and that separation laws merely reflected that reality. Racial biology had long attempted to justify enslavement arguing that without the firm hand of White masters, African Americans were mentally and physically incapable of taking care of themselves. This prevailing sense of natural Negro inferiority was further expressed as the court commented, "The argument also assumes that social prejudices may be overcome by legislation, and that equal rights cannot be secured to African Americans except by an enforced commingling of the two

racess. We cannot accept this proposition" (163 U.S. at 551).

The lone dissent in this case was by Justice John Marshall Harlan, a former enslaver from Kentucky who became a successful attorney after the Civil War before joining the Court in 1877. For Harlan, the Thirteenth and Fourteenth Amendments had to be read together to get a true understanding of their meaning. In his view, the amendments not only abolished enslavement, but all badges and incidents of its practice, including all formal discriminations that might be imposed by state law that the equal protection clause was designed to eliminate. The Fourteenth Amendment had also elevated African Americans to the status of citizen of the United States. To be equal before the law as a U.S. citizen meant to be free from any distinctions imposed by law based upon race or color. State laws that drew distinctions between citizens might be reasonable in other respects, but could never be reasonable if their distinctions were based on race. Louisiana's statute while calling for separate-but-equal accommodations did not meet this standard simply because racial distinctions at law were precisely what the equal protection clause prohibited.

Harlan aptly pointed out that the real purpose of the law was not to keep Whites from sitting in rail cars designated for African Americans, but the reverse. This he saw as simply another disability flowing from customs practiced prior to the reconstruction amendments, now carried out by law. Although Harlan harbored the same biases about African American inferiority as Brown, he was adamant that the equal protection clause did not sanction this false distinction between social rights and political rights. This law he argued was a "badge of servitude wholly inconsistent with the civil freedom and equality before the law established by the Constitution" (163 U.S. at 562).

Harlan added to his reputation as the great dissenter with this opinion and his similar views from the civil rights cases. He further warned,

In my opinion, the judgment this day rendered will, in time, prove to be quite as pernicious as the decision made by this tribunal in the *Dred Scott* case. . . . The present decision, it may well be apprehended, will not only stimulate aggressions, more or less brutal and irritating, upon the

admitted rights of colored citizens, but will encourage the belief that it is possible, by means of state enactments, to defeat the beneficent purposes which the people of the United States had in view when they adopted the recent amendments of the Constitution. (163 U.S. at 560)

But the Court had spoken, and from its perspective, the *Plessy* opinion was not remarkable in any way. The Court had already validated several other state discrimination laws, including those involving rail car segregation and now, based on *Plessy*, would continue to do so until *Brown v. Board of Education* in 1954.

Impact of the Ruling

The story of the *Plessy* case is a complicated tale for complicated times. The case did not mark the beginning of forced segregation since a number of cases had upheld the propriety of segregation statutes in both Northern and Southern states prior to 1896. What *Plessy* did do, however, was slam a constitutional door in the face of African Americans who urged an expansive view of the Fourteenth amendment as an avenue for pursuing equality. Little is recorded about Plessy's activities following the case, although we do know that he died in 1925. Tourgee received a consular appointment to serve the U.S. government in France under the administration of President William McKinley. He died in France in 1905. Martinet went on to continue to his work in New Orleans as a lawyer and a physician and died in 1917. The Citizens Committee to Test the Constitutionality of the Separate Car Law had a few hundred dollars left after the litigation, which they gave to charity and then disbanded.

Brown's opinion in *Plessy* focused mostly on the constitutionality of Louisiana's separate car statute, but gave little attention to the equal requirement for those separate accommodations. If Louisiana's statute was unique, it was not that it permitted the state to deny service to African Americans, but that it imposed a criminal sanction on anyone who sought to circumvent its mandate.

Forced separation was the new law of the land, and separation laws were soon passed to cover a host of public services that were either denied outright to African Americans or only provided with inferior

quality. The constitutional principles from *Plessy* were not confined to matters dealing with transportation. This pernicious equal-but-separate doctrine crept into every conceivable aspect of life in the Deep South. Not only was transportation affected, but schools, public housing, restaurants, hotels, libraries, parks, and every type of public welfare institution including hospitals were now segregated by law. The level and degree to which separation was enforced seemed only limited by the White imagination and was quickly followed by the rule of law. Interracial marriage was outlawed, prisons were rigidly segregated, wash houses in coal mines, every aspect of the military service, and even telephone booths were segregated. A Florida statute even went so far as to require textbooks that were used by different races in the public schools to be stored in separate facilities.

Maintaining these laws that were now constitutionally sanctioned also required a vigorous assault on the African American franchise. During Reconstruction, African Americans had gained considerable political influence in the statehouses throughout the South. Although most of their representation was lost with the end of Reconstruction, the African American vote was still significant and often was the swing vote between competing White factions. But even this degree of political influence was seen as a potential threat to segregation, so Whites responded with laws, intimidation, and violence to gradually suppress the African American vote and to ensure unchallenged White supremacy throughout the South.

POVERTY AND EDUCATION

The relationship between poverty and education is complex. Although living in poverty does not

determine children's educational paths, poverty certainly has a profound effect on poor children's access to high quality educational opportunities. Poverty affects children's physical, emotional, and cognitive development, and the schooling experiences of children living in poverty are full of severe obstacles to high-quality education. However, children living in poverty are not uneducable. Contrary to stereotypical beliefs, most parents with children living in poverty want the best for their children and care about their education. This entry provides information on poverty in the United States, particularly pertaining to children, and discusses how poverty influences the schooling experiences of African American and poor and low-income children.

Social Causes and Consequences of Poverty

Poverty affects rural, urban, and suburban areas. The official poverty measure in the United States is based on data collected in the 1950s. These data indicate that families spent about a third of their income on food, so the poverty level was set at 3 times food costs. Since then, the measure has been updated only for inflation. The measure is widely accepted to be inadequate. Other factors for the cost of living such as housing, child care, health care, and transportation have grown disproportionately and are not currently factored into the measurement.

Causes of Poverty

Poor people do not cause poverty. Stereotypical characteristics attributed to poor people (laziness, promiscuity, lack of work ethic, poor judgment, devaluation of education, failure to accept personal responsibility) are not causes of poverty. Poverty in the United States is a result of the politics of distribution. In wealthy countries such as the United States, there is no scarcity of food, shelter, health care, or opportunity; rather, poverty in this country results from the ways in which social goods and opportunities are distributed. Poverty is created and sustained by numerous human decisions institutionalized in social politics and practices.

Many jobs simply do not pay enough to support a family. Nearly 35 million U.S. citizens—one quarter of the U.S. labor force—earn poverty-level wages with little opportunity for advancement.

The gap between the rich and the poor more than doubled between 1979 and 2000. The richest 1% in 2000 had more money to spend after taxes than the bottom 40%. Such economic disparity did not just happen. Government policies beginning in the 1930s encouraged racial and economic segregation. For example, the work of the Home Owner's Loan Corporation distributed racial and ethnic demographics maps to banks and used the maps to hold banks to a certain standard when loaning money for homes. Practices such as this contributed to the creation of poor inner-city neighborhoods and the phenomenon known as White flight. Other government policies that supported White flight include the GI Bill of 1944 and the Interstate Highway Act of 1956.

Social stratification is at play between the rich and the poor. As a result of geographical and economic segregation, the poor are pitted against each other. The current rhetoric of Latino immigrants being willing to do more work for less wages than African Americans only fuels racist notions of African Americans being parasites and undeserving welfare recipients.

Although poverty is detrimental to the poor, it can be quite profitable for others. Check cashing businesses are plentiful in poor communities. They prey on people without access to banks or who are unable to meet minimum balance requirements. In 1993, these enterprises cashed 150 million checks and charged \$700 million in fees. Rent-to-own stores are also abundant in poor communities. These establishments often end up charging 5 times as much as people would pay for furniture or appliances in retail stores.

Demographic Data

The official poverty level in 2007 was \$20,650 for a family of four. Yet it takes nearly twice that to meet a family's needs. Millions of low-wage workers have incomes above the federal poverty level, but cannot afford to meet their families' most basic needs. To assist low-wage workers and their families, the federal and state governments provide a set of work-supports benefits such as earned income tax credits, child care subsidies, health care coverage, and housing assistance. These benefits are means tested, so as earnings increase, particularly as they rise above the official poverty level,

families begin to lose eligibility even though they are not yet self-sufficient. The result is that parents can work and earn more without their families moving closer to financial security. A low-wage job simply is not enough to make ends meet.

U.S. child poverty rates exceed those of all other wealthy industrialized nations. There are 13 million poor children living in the United States. Child poverty in the United States continues to grow. Every 36 seconds, a child is born into poverty. Today, there are 1.2 million more children living in poverty than there was in 2000, an increase of 11%. Although there are more poor White children in the United States, children from underrepresented groups are disproportionately represented: 10.8% of White children are poor, 40% of American Indian children are poor, 35.3% of African American children are poor, 28% of Latino children are poor, and 12% of Asian children are poor. According to the Children's Defense Fund, there is a dangerous intersection between race and poverty. African American children are more than 3 times as likely as White children to be born into poverty and to be poor and are more than 4 times as likely to live in extreme poverty (meaning their families have annual incomes of less than half the federal poverty line). One in three Latino babies and two in four African American babies are born into poverty.

A majority of children living in poverty have working parents who, despite playing by the rules, cannot earn enough to escape poverty. More than 80% of children living in poverty have at least one parent who works; 55% have a parent who works full-time year-round. A minimum wage job pays only 58.9% of the federal poverty level for a family of four. Poor children are more susceptible to suffer from hunger, homelessness, untreated illness (such as asthma, ear infections, and tooth decay), lead poisoning and other forms of environmental pollution, violence, and family dissolution. Many children who grow up in poverty do well despite the hardships; however, as a group, poor children are behind their middle- and upper-class counterparts in educational achievement. Schooling is not a level playing field for children living in poverty.

Schooling Experiences of Poor Children

Social class stratification in U.S. society influences educational outcomes for all children. Children

differ in the kinds of knowledge they bring with them when they enter school, and these differences are strongly influenced by their social class backgrounds. Children from middle-class or more affluent families have had the financial resources to acquire particular kinds of social experiences (e.g., trips to museums, lavish family vacations, participation in organized sports, music lessons) that are rewarded in school. Middle-class values are typically aligned with those of schools, and therefore the home-to-school transition is more seamless for middle-class children. Given that the current teacher populace is composed of mostly middle-class teachers, a child who enters school from a middle- or upper-class background will be considered easier to teach than one who has not had experiences similar to most teachers, so the achievement gap begins.

Social class also influences the kinds of parental involvement valued by schools. Teachers perceive parents who are able to volunteer in the schools, classrooms, and on fieldtrips; attend parent teacher conferences; and immediately return phone calls from the school as highly involved. Parents who may not be able to participate and respond in such ways because of having lower wage jobs with less flexibility or lack of transportation are viewed as uninvolved and not caring about their children's education. This perceived lack of parental involvement is then cited as reasons for low academic achievement among poor and low-income children.

Poor and low-income children are more likely to attend low-quality schools. Such schools are characterized by scant resources, untrained and undercompensated teachers, and run-down or unsafe buildings. Jonathan Kozol has well documented the deplorable schooling conditions for poor and low-income children. In schools across the nation, children are allowed to attend schools where there are crumbling foundations, holes in roofs, raw sewage in the basements, and mold and mildew; where there is no toilet paper or hand soap and no playground equipment; where there are outdated textbooks; and where there is overall insufficient funding.

In addition to poor schooling conditions, the problems that poor children are more susceptible to affect their learning in school. Because of lack of access to health care, poor and lower-income students, overall, are in poorer health. Fifty percent or

more of poor children have vision problems that interfere with their academic work. Poor and low income children also have more hearing problems. Children with toothaches pay less attention in class than children with healthy teeth. Children who live or attend school in older buildings have greater exposure to harmful environmental toxins. Poor and low-income children have higher blood lead levels than middle-class children.

Reform Efforts

Over the years, many reforms have been put forth in attempts to close the achievement gap between poor and middle class students. Education reform efforts aimed at closing the achievement gap across K–16 education include Head Start, Title I Schools, and the Federal TRIO Programs such as Upward Bound.

Head Start is a national program that promotes school readiness by enhancing the social and cognitive development of children through the provision of educational, health, nutritional, social, and other services to enrolled children and their families. The Head Start program provides grants to local public and private nonprofit and for-profit agencies to provide comprehensive child development services to economically disadvantaged children and families, with a special focus on helping preschoolers develop the early reading and math skills they need to be successful in school. Head Start programs engage parents in their children's learning and help them in making progress toward their educational, literacy, and employment goals. Significant emphasis is placed on the involvement of parents in the administration of local Head Start programs.

Title I is the largest federal aid program for U.S. schools. Title I began in 1965 under President Lyndon B. Johnson as part of his war on poverty. The purpose of this title is to ensure that all children have a fair, equal, and significant opportunity to obtain a high-quality education and reach, at a minimum, proficiency on challenging state academic achievement standards and state academic assessments. Title I money is given to districts to help students in schools affected by poverty. It is intended to help close the achievement gap between schools in affluent neighborhood and schools from poor communities. Title I money can be used in

two different ways in a school. In one program, called a Targeted Assisted Program, the money is used to provide support for students targeted as low performing in reading or math. Another type of Title I program is called a schoolwide program. In a schoolwide program, Title I money is used to benefit all of the children in a school. A schoolwide program is guided by the schoolwide program plan and a school leadership team. Title I money is typically used to provide extra staff, materials, or professional development for these schools. The program specifically supports reading and math. The federal government measures a school's poverty level by the number of students receiving free or reduced lunch. All children attending a Title I school operating as a schoolwide program are eligible to receive services from Title I. Thus, in a schoolwide program, all students are Title I students and all teachers are Title I teachers. How Title I resources and staff are used in a schoolwide program is decided by the school leadership team and guided by the schoolwide program plan.

The Federal TRIO Programs are educational opportunity outreach programs designed to motivate and support students from disadvantaged backgrounds. TRIO includes six outreach and support programs targeted to serve and assist low-income, first-generation college students, and students with disabilities to progress through the academic pipeline from middle school to postbaccalaureate programs. TRIO also includes a training program for directors and staff of TRIO projects and a dissemination partnership program to encourage the replication or adaptation of successful practices of TRIO projects at institutions and agencies that do not have TRIO grants. Upward Bound provides fundamental support to participants in their preparation for college entrance. The program provides opportunities for participants to succeed in their precollege experiences and ultimately in their higher-education pursuits. Upward Bound serves high school students from low-income families, high school students from families in which neither parent holds a bachelor's degree, and low-income, first-generation military veterans who are preparing to enter postsecondary education. The goal of Upward Bound is to increase the rate at which participants complete secondary education and enroll in and graduate from institutions of postsecondary education.

In the end, raising the achievement of poor and low-income children requires restructuring of the social and economic conditions of their lives.

PREDOMINANTLY BLACK COLLEGES AND UNIVERSITIES

Predominantly Black colleges and universities (PBCUs) are those institutions with a 50% or

greater enrollment of African American students. These colleges are not to be confused with historically Black colleges and universities (HBCUs). Like HBCUs, PBCUs serve large numbers of African American students. Whereas HBCUs refer to institutions of higher learning founded to educate the descendants of formerly enslaved Africans prior to 1964, PBCUs were not necessarily founded with a mission of educating African Americans. The year 1964 is also significant because it marked the passage of Title VI of the Civil Rights Act, which prohibits discrimination on the basis of race, color, or national origin regarding federally assisted programs and activities. HBCUs are federally designated as institutions that were founded prior to 1964. However, PBCUs may or may not have been founded prior to 1964.

The term *predominantly black colleges and universities* denotes distribution of a race of students rather than a historical mission or federal designation. Federal data show that approximately 54 PBCUs exist nationally (see Table 1). Unlike HBCUs, PBCUs are spread across the nation from the East Coast to the West Coast. In addition, PBCUs are more easily located in urban-metropolitan region, more likely to hold 2-year institution status, or more likely than HBCUs to be branch campuses of a larger college system.

The extant literature on predominantly Black colleges is often mistakenly embedded with the literature on HBCUs. This confounding in the literature leads to misconstruction of the two institutional types that, though they serve similar groups of students, have two divergent realities. HBCUs are eligible for special federal aid, while PBCUs do not share the same federal designation that would shape these institutions' eligibility. Unlike PBCUs, HBCUs were founded during legal segregation expressly for the education of formerly enslaved Africans. Over time, African American students have come to make up a larger part of the enrollment at PBCUs, a percentage which has contributed to conflation of the two institutional types. At the same time, HBCUs increasingly began serving White students over time. These changes are important in viewing both institutional types within a larger higher education discourse.

Another characteristic of PBCUs has been institutional mergers with other institutions. In some cases, newly established colleges and universities

have resulted from mergers of PBCUs and potentially more than two preexisting colleges. For example, Davenport University (Michigan and Indiana) was founded when Davenport College, Detroit College of Business, and Great Lakes College merged in 2000. This merger allowed the individual campuses to maintain geographical locations, maintain local history and identity, and gain the ability to appeal to more students by offering a greater variety of courses and other resources.

Another strategy some PBCUs have used is to change the name of the institution in ways expected to broaden institutional appeal. For example, Macon Technical Institute (in Georgia) is now Central Georgia Technical Institute, and Metropolitan Community College (in Illinois) is now East St. Louis Community College Center. Although these institutions remain the same at the core, their current names better reflect the areas they serve, a change which may also help in attracting students. These institutions represent a full range of institution types, missions, and histories. Like other higher-education organizations, PBCUs also employ a variety of strategies to succeed in maintaining needed student enrollments.

PREDOMINANTLY WHITE INSTITUTIONS

Predominantly white institution (PWI) is the term used to describe institutions of higher learning in which Whites account for 50% or greater of the student enrollment. However, the majority of these institutions may also be understood as historically White institutions in recognition of the binarism and exclusion supported by the United States prior to 1964. It is in a historical context of

segregated education that predominantly White colleges and universities are defined and contrasted from other colleges and universities that serve students with different racial, ethnic, and/or cultural backgrounds (e.g., historically Black colleges and universities, HBCUs). U.S. higher education is rooted in the establishment of the predominantly White college but over time has changed and proliferated. This entry addresses the historical development, significance, and impact of PWIs.

The patterns and traditions of predominantly White colleges and universities are rooted in those of Western Europe. More specifically, according to John Brubacher and Willis Rudy's 1997 *Higher Education in Transition: A History of American Colleges and Universities*, predominantly White colleges and universities turned to Oxford and Cambridge for models of higher education in the colonial period. Brubacher and Rudy assert that the prototype for the first predominantly White college is Emmanuel College, Cambridge University. Harvard College, founded in 1636, took its statutes from the Elizabethan statutes of the University of Cambridge and subsequently became the model for colleges founded later in the United States.

In "The Ten Generations of American Higher Education," published in 1999, Roger Geiger details the history of U.S. institutions from the early 17th century to the present era. He identifies the period of 1636 to 1740 as the reformation beginnings. This period is critically important as emerging predominantly White colleges Harvard (1636), William and Mary (1693), and Yale (1701) developed during this era. Following the pattern set forth by Emmanuel College (1584), church officials were intricately involved with the operation of these institutions. Specifically, the Christian tradition was the cornerstone of the whole intellectual structure of colleges and universities. This religious presence, therefore, heavily influenced the mission of the early colleges, which were intended was to train young White men for the ministry. It has been suggested that because religious leaders during this period held dual positions in the church and the government, the early institutions were responding to the public need for an educated clergy.

Although these institutions served a public good, the reformation era did not provide universal

access to education. Rather, education during this period was located in the Northeastern states and reserved for the upper-class members of society and designed to maintain the established social class system. According to Geiger's 1999 work, the students received a liberal education, focusing primarily on Aristotle's philosophies of ethics, natural science, and metaphysics. Concomitantly, the reformation colleges valued the classical languages of Latin and Greek. Latin was logically the fundamental discipline because it was the language of the law and the church. Due to the oral culture that prevailed, institutions expected students to master this language to communicate and grow in the knowledge of the world.

As time progressed, the birth of various colleges sparked an increase in student enrollment and a change in curricular content. The founding of the College of New Jersey in 1746 was significant because it broke the mold of the reformation, according to Geiger. This institution was a provincial college and served a significant Presbyterian population. Notwithstanding, the proliferation of colonial colleges (King's College, College of Philadelphia, College of Rhode Island, Queen's College, and Dartmouth) increased enrollment by accepting students belonging to other religious denominations. Gradually, however, a more secular approach to education emerged as a result of the development of separation of church and state during the American Revolution and establishment of the United States of America, despite the church affiliations of these colleges. These institutions also began to welcome students from less prominent families, particularly the sons of farmers.

Challenging the Classics

The early 19th century began with criticism of the classical college and its focus on Latin and religion. Frequently, critics argued that colleges were obsessed with dead languages, neglected more practical subjects such as science, and struggled to adequately address disgruntled students' unruliness, according to Geiger. This dissatisfaction with the education system reflects the growing interest of students and institutional types. The goal of pursuing higher education for the sake of training for life was no longer the law of the land. During this period, the world began to change as students

rebelled, and social reform efforts gained momentum. More institutions developed professional schools, such as law, theology, and medicine. Students began desiring a more vocational-specialized educational curriculum. As priorities of the population shifted, the need for liberal education came into question.

Although some demanded that higher-education systems move beyond the classical liberal education, others greatly opposed this suggested change. The Yale Report of 1828 is evidence of such opposition. Issued by Jeremiah Day and James Kingsley, the Yale Report served as the first unified statement of educational philosophy that focused specifically on the nature of liberal education, according to C. Conrad and J. Wyer's 1980 work. The document was a defense of the classical curriculum against the rising interest in more practical courses. According to the Yale Report, the purpose of an undergraduate curriculum is to lay the foundation of a superior education. To accomplish this goal, institutions were to furnish the mind with knowledge and create mental discipline for thinking. The curriculum, therefore, was to be limited to the classic texts, philosophy, and mathematics. The Yale Report rejected the idea that students should specialize in particular areas of study because supporters of this philosophy believed that it crippled students' ability to reason, think critically, and analyze information. This report recognized and appreciated the framework outlined by the reformation and Colonial colleges. It suggested that educational institutions return to the mission as espoused early on by these institutions and revitalize liberal education, teaching students to value the process of learning and to succeed in life rather than training them for the labor market.

Despite the objections of the Yale Report, higher education did become more specialized and market influenced. Many institutions expanded their curricular offerings to include various courses not previously included in the trivium and quadrivium (the classic liberal course preferred by the Yale Report). One of the strongest forces behind this curricular change was the Morrill Land-Grant Act of 1862, an important event in the maturation of the curriculum shift from the general-liberal model to the utilitarian-vocational educational model. The Morrill act provided for the establishment of public institutions in every state with the support

of the federal government. States did not have the resources needed to subsidize higher education, and government subsidies and land donations presented the best way to ensure that every state entered the realm of higher education. These institutions centered on providing training in industrial education, agriculture, and the mechanical arts. The Morrill act is significant with regard to the mission of higher education because it broadened the scope of educational opportunity. With these new objectives, students gained more choices that enabled them to move beyond the classical curriculum offered at most institutions. During this time, there was increasing interest in specialized education, which grew out of students' desire for training in a particular profession to acquire a specific skill. Practical education attained a greater influence over the mission operating in higher education.

Although the curriculum changed, higher education remained primarily the province of White males until after the Civil War. Following the war, the demise of enslavement promoted other social revisions and reforms including attacks on educational exclusion, which permeated the nation. Women and minorities used this time to fight for educational access and equal rights. Responding to these new demands, higher education took action. Although the process of equalization of educational opportunity occurred gradually, colleges and universities began to open admissions to both women and minorities during the mid-19th century.

Even as education expanded to make place for those previously enslaved, these efforts generally resulted from a need to protect the social, political, and economic dominance of White men. The desire to ensure that the nation's (White) sons received a good foundation and upbringing sparked interest in the educational opportunities available to White women outside of the home. In 1837, Oberlin College became the first institution of higher education to admit women. However, between 1861 and 1875, Matthew Vassar, Henry Wells, Sophia Smith, and Henry Durant created colleges exclusively for women. These institutions allowed women to fully participate in higher education at institutions where they were the focus of both the curriculum and the administration. Although the mission of these colleges catered to the needs of women, the purpose was to educate them to succeed at the tasks assigned to them in an industrializing society, especially

rearing educated children who could contribute to the progress of the nation).

Despite the heterogeneity of the U.S. population, predominantly White colleges and universities were challenged in accepting students who were not White Anglo-Saxon, Protestant (WASP) men. When White women integrated predominantly White colleges, the conventions of the Victorian culture of that time insisted upon separation of the genders. Men were viewed as natural leaders in public, political, and economic venues, while women were relegated to uneducated lives in which they tended to household and children. White women, particularly those who lived in the antebellum North, gained access to higher education on the basis that secondary education only equipped women with tools needed to be better wives and mothers. In tandem, unmarried women largely used higher education to prepare themselves for teaching professions. Selective admissions plans became restrictive admissions policies to maintain the WASP tradition.

In the early 1900s, colleges were still seeking to preserve higher education for the sons of WASP businessmen or professionals. Elite predominantly White colleges of the 1920s and 1930s were rooted in ethnic and class prejudice. After World War II, critical numbers of liberal arts colleges chose to limit the size of their classes and to seek national and upper-middle-class students at the expense of local and more diverse students. With little accountability, restrictive admissions policies lent themselves well to excluding Jewish students who were egregiously discriminated against when they applied to elite colleges in the Northeast. This Jewish problem, as it is described in the literature, was further shaped by no formal admissions procedures, modest attempts to attract regionally diverse students, widespread antisemitism, and an increase of Jewish applicants. Institutions adhering to these quotas included Dartmouth, Harvard, and the New England colleges. College admission endeavors were obsessive as intellectually competent students were treated in ways that showed them they were socially undesirable.

Predominantly White institutions have expanded since the founding of Harvard College in 1636 to include an array of institutions. As a result, the early purpose of solely educating wealthy, White males for the ministry evolved into increased access and

educational opportunity for all people in an effort to meet the changing needs of society. Today, predominantly White institutions lead the way in selectivity in higher education, sometimes demanding that all potential students have high grade point averages and standardized test scores. This transformation and expansion, however, remains the subject of much debate and criticism among educational researchers, policymakers, and the public at large.

PRIVATE AND PUBLIC FUNDING

The question of who should pay for schools has existed throughout the history of public schools in the United States. Historically, the burden for funding schools was placed on parents, lotteries, or philanthropies, but this gradually gave way to notions of public responsibility through levied tax. Education finance debates, both national and statewide, have intensified throughout the years, although the question of who should pay has been decided for the most part by the legal system. Embedded within this debate are conversations on school improvement and educational equity

between students, with specific regard to race, ethnicity, gender, or socioeconomic status. For African American students nationwide, the question of who should fund the schools is particularly important because the very schools attended by a majority of students from underrepresented groups are traditionally underfunded, racially isolated, and criticized as low performing. This entry reviews a key debate involving public versus private funding: the issue of school vouchers.

In the Supreme Court decision in *San Antonio v. Rodriguez* (1973), plaintiffs charged that the Texas system of financing discriminated against poor and minority groups residing in school districts with a low property tax; the decision to fund schools based on property taxes in the locale disproportionately favored wealthier students. The Court ruled that education was not a fundamental right under the federal Constitution, and therefore, students are not entitled to an equal education regardless of class under the U.S. Constitution.

This decision, however, did not affect the federal government's right to collect taxes to be distributed to the nation's public schools. Overall, school funding is provided by multiple sources: municipalities, counties, general tax revenues, states, and school districts, in addition to the support of the federal government. Still, the debate surrounding who should pay for schools and general child welfare persists between those who support a free-market strategy and those who favor strong government involvement and interventions within the educational arena.

Arguments for Free-Market Policies

Free-market policies encourage private enterprise and consumer choice while also rewarding personal responsibility and entrepreneurial initiative. Those in support of placing the education system on the free market to encourage educational reforms propose that this option ensures that schools compete for the best students, which in turn results in better-quality schools for all students on the market, they believe. Proponents assert that schools should not serve teachers and state bureaucracies but should instead serve the students and families—the consumers—who have come to rely on them. They expect newly created parental or consumer choice to guarantee democracy by opening better-quality

schools to more students. By shifting education to the market through school choice plans, which implement vouchers and charters, supporters of this strategy expect education to become a largely self-regulating enterprise. Specifically concerning both race and class, proponents of education as a free-market entity maintain that choice enhances parental voice and allows entrée into traditionally closed spaces.

Advocates contend that the overt goal of choice plans is to provide those with fewer material resources an equal right to exit poorly performing neighborhood public schools in favor of higher-quality options. Due to the increasing competition among schools, the market should serve as a catalyst, producing natural educational reforms, which in turn enhance both the efficiency and responsiveness of schools, while also ensuring a better-quality product.

Opponents of the Free-Market Approach

In stark contrast, proponents of continued and increasing responsibilities of the government assert that any ties between education and the economy should be severed, as this would only lead to the magnification of existing social divisions involving race, class, and gender. Critics of the education-market approach maintain that few students in need will be able to capitalize on school choice programs, and subsequently the static academic improvements resulting from parental inexperience or access will be portrayed as the poor consumer choice of the affected groups.

An additional contention is that the long-term effect of school choice programs will lead to the increase of White flight from public schools into insulated private and secular schools. Also, there is a serious threat to the public school itself, as citizens might become disengaged with public school improvement efforts, resulting in debilitating consequences for at-risk schools. Instead, critics contend that to improve the quality of education for all students, preexisting social, economic, and cultural inequities must be addressed structurally and consequently implemented through federal reforms.

Should the government unleash the market on education, critics insist that such policies in practice would reproduce traditional hierarchies of race, class, and gender. Warning of the negative effects of

school choice programs in England and New Zealand, defenders of the idea of a strong government role in education suggest that U.S. policymakers should approach the free market with caution, as research suggests that markets privilege families with higher-socioeconomic status through their knowledge and material resources and have a negative effect on the academic performance of schools with a majority working-class and minority populations.

Outcomes

Since the Supreme Court ruling in *Zelman v. Simmons-Harris* (2002), there have been many statewide choice programs. In this judgment, the Court upheld an Ohio law that provided vouchers to families whose children attended Cleveland's failing public schools to be applied to both public and private—including both parochial and secular schools. The controversial debate surrounding the legality of the use of public dollars for private and religious schools was solved as Court decisions in *Agostini* (1997), *Helms* (2000), and *Zelman* (2002) indicated that the religious provisions of the First Amendment would not be interpreted to prevent public funding of religious schools.

After the Court's support of policies instrumental in school choice programs, many choice programs have been implemented throughout the United States. In 1990, the Wisconsin state legislature enacted the nation's first voucher program, affording low-income parents the choice of enrolling their children in private schools. The Milwaukee Parental Choice Program later expanded to include parochial schools. Supporters assert that the original design of the voucher program attracted a majority of African American and Hispanic families with low incomes and thereby serves as an example of the successful targeting of low-income families to improve educational opportunities. Critics of the program argue that it removes the more educated and involved parents from the public school system. After 18 years of operation, results continue to be mixed.

R

RACISM INSIDE THE RACE: LIGHT SKIN VERSUS DARK SKIN

The term *colorism* is used to describe discrimination within a racial group based primarily on skin hue or color and may also include other physical characteristics such as hair texture and eye color. In the United States and in other countries around the world, the practice of colorism, based within a framework of racism, shows preferences for light skin over darker skin within a community of color. People whose physical features of skin color, hair texture, and eye color are closest to the European standards of beauty are more likely to be afforded greater educational, economic, and social status than their brown- to dark-skinned brothers and sisters.

Colorism among African Americans has its origin in the U.S. enslavement period when enslavers mated with enslaved Africans. The lighter-skinned children of these unions were more likely to be enslaved in the household, while the dark-skinned enslaved Africans worked in the fields. Some of the light-skinned enslaved Africans learned the social skills of the enslaver's household, were sent away to be educated, and were sometimes freed upon the death of the enslaver. Following emancipation, many of these light-skinned formerly enslaved Africans were able to lead more privileged lives because of the advantages they had experienced. In order to maintain this light-skinned advantage, affluent African Americans developed a number of strategies to bar their dark-skinned brothers and

sisters from their lives. "Blue vein societies" required skin to be light enough for blue veins to be visible in one's forearm, while other clubs may have required one to be lighter than a "paper bag." These tests were not only used as entry to social clubs but as admittance to selected churches as well. For example, some churches required that the attendees meet the criteria set by the light shade of brown of the painted entrance door, while others were not welcome if they could not meet the "comb test" that was determined by one's ability to use a fine-toothed comb that moved smoothly through the hair and did not snag because of kinky hair.

Because of the preferential treatment given to those with lighter skin by both Whites and African Americans, brown- to dark-skinned African Americans, especially women, pursued various avenues to acquire the attributes of European standards of beauty. Two of the most frequently used practices in the 19th and 20th centuries (as well as currently) were skin bleaching and hair straightening. Advertisements appeared in African-American-oriented newspapers and magazines promoting products to achieve these goals. One such ad appeared in the *American Star* (1903) and featured a black skin remover (bleach) and hair straightener in one box. The ad noted in part,

A PEACH-LIKE complexion obtained if used as directed. Will turn the skin color of a black or brown person four or five shades lighter, and a mulatto person perfectly white. In forty-eight hours a shade or two will be noticeable.

The ad included a “before” picture with black skin and kinky hair and an “after” picture with white skin and straight hair. In the 21st century, brown- to dark-skinned women continue to use skin bleach and hair straightening products (and/or wigs) in attempts to acquire the economic and social advantages that are afforded those who meet European standards of beauty. In addition, for those who can afford it, plastic surgery on lips and noses and the wearing of contact lenses to change eye color are also available.

Several researchers (Hughes & Hertel, 1990; Hunter, 2002; Seltzer & Smith, 1991; Thompson & Keith, 2001) have used five major categories of skin tone to describe the differences in skin color often recognized among African Americans: very dark brown, dark brown, medium brown, light brown or light skinned, and very light brown or very light skinned. A case study of an African American school community in a small southern town reported by Morris and Morris (2002) documents events that are a microcosm of findings about colorism practices in the larger society. Citizens of most African American communities are aware of songs or poems that communicate those with light skin are preferred over dark-skinned children or adults, as this poem states:

If you're white, you're right,
If you're yellow, you are mellow,
If you're brown, stick around,
If you're black get back.

Light-skinned girls were preferred as playmates, majorettes, for leading roles in school plays, and as homecoming queens at high schools and Black colleges. They had more boys vying for their affections. High school students were told to consider the color of the person they planned to marry, in the best interest of their children. It was clear that African Americans felt that lighter skin was better. It appeared that most of the African American men who were considered to be well off in the community had light-skinned wives, even though many of the men were brown to very dark. It is evident that this virus of preferential treatment of light skin and other characteristics that symbolize European standards of beauty has invaded communities throughout this country and the world.

During the brief “Black Is Beautiful” period of the late 1960s and early 1970s, African Americans expressed pride in their dark skin and kinky hair. However, despite the political preference for dark skin and natural hair during this period, the advantages afforded light-skinned people still persist in the African American community in the 21st century (see, for example, Golden, 2004; Russell, Wilson, & Hall, 1993; Thompson & Keith, 2001). This phenomenon can be seen in the skin tone of African Americans who hold important positions in national and state government, men and women reporters and anchors on television, women in television dramas and advertisements, and the lighter skin tone of women who successful men choose to marry.

The statement made by Dr. Martin Luther King Jr. more than 40 years ago that communicated his dream that his children would be judged by the content of their character and not by the color of their skin is still a dream and not a reality among many African Americans today. Much work remains to be done in our homes, schools, churches, communities, businesses, and in the halls of local state and national government in order to eradicate this very destructive virus that affords educational, economic, and social advantages based on skin color within the African American community.

REGENTS OF THE UNIVERSITY OF CALIFORNIA V. BAKKE

In 1973 and 1974, Allan Bakke, a White male, was denied admission to medical school at the University of California, Davis (UC Davis). He sued the University of California, alleging that his application for medical school had been rejected because of a special admissions program UC Davis had established to increase enrollment of students from underrepresented groups. Because the program set separate criteria for the admission of underrepresented students, Bakke charged that he had been a victim of reverse discrimination, in violation of Title VI of the Civil Rights Act and the equal protection clause of the Fourteenth Amendment. When two state courts ruled in his favor, the university asked the U.S. Supreme Court to review the case.

In 1978, in a 5–4 decision, the Supreme Court ruled against the university. This decision has had broad repercussions for affirmative action

programs in a variety of contexts. In a carefully worded concurring opinion, Justice Lewis Powell asserted that the goal of diversity was a constitutionally acceptable state interest and set out guidelines for how a program to promote diversity might operate. His opinion, though not the opinion of the Court, continues to have influence in similar cases.

Historical Context

The mid-1960s saw the civil rights movement turn north and target institutional discrimination in areas that had never been part of the old Jim Crow system. It was also a time in which the movement fragmented. Nonviolent civil disobedience gave way to more militant protests and at times even violent demonstrations. In the aftermath of some of these urban rebellions, a number of colleges and universities noted that their campuses were almost all White, a form of de facto segregation. This was especially troubling to schools located in or near urban centers or in states with large populations of underrepresented people. While these schools never consciously excluded members of underrepresented groups, neither had they reached out or encourage their attendance.

Affirmative action as we know it now began its evolution following President Lyndon Johnson’s signing of Executive Order 11246 in 1965. The order not only prohibited discrimination by federal contractors and subcontractors but also required that they take “affirmative action” to correct the effects of past and present discrimination. Recipients of federal contracts had to develop a plan designed to increase the participation of members of underrepresented groups in their workforce. Goals and timetables were required to demonstrate the “full utilization of minorities and women” in these projects.

This was a radical approach to addressing societal discrimination because it did not depend on judicial finding of discrimination in individual cases. This focus on societal discrimination began to extend beyond the field of federal procurement, and many colleges and universities saw the policy as a mandate to recruit, enroll, retain, and graduate increasing numbers of students from underrepresented groups. These plans were based on an acknowledgment that although most U.S. colleges

and universities outside of the Deep South had not formally excluded underrepresented students, that the slow, or in many cases complete failure to implement the desegregation promises of *Brown v. Board of Education, Topeka, Kansas* (1954) millions of students in substandard public schools and at a distinct disadvantage in competing for seats in many colleges and universities.

After 1954, desegregation became at least the technical letter of the law, but by 1965, affirmative action and integration became its spirit. It was against this backdrop that the special admissions program at the UC Davis Medical School was created and the constitutional issues that were to be addressed by a succession of courts began.

There is no single date universally recognized as the beginning of affirmative action in higher education. Different schools experimented with different methods, all seeking in their own way to increase the number of students from underrepresented groups in their classes. If there was a common thread that tied these programs together, it was a general recognition that promising students from underrepresented groups might not all demonstrate the same traditional indicators of success as White applicants who frequently came from better school systems with a tradition of preparing students for college enrollment. While urban schools were generally not legally segregated, many experienced the same degree of racial isolation as the schools in the Deep South. To address these issues of differing levels of college preparedness, affirmative action in higher education used differential enrollment standards to ensure that students from underrepresented groups could enroll in their institutions and take advantage of the social mobility that higher education offered. By the early 1970s, various forms of affirmative action in college enrollment had spread to graduate and professional schools. This was the environment in higher education in 1973, when Bakke made his decision to give up a promising career in engineering and apply to medical school at UC Davis.

Facts of the Case

Bakke was from a modest middle-class background. He graduated with honors from the University of Minnesota in 1962, with a BS in

mechanical engineering. Despite his success as an engineer, including some graduate work, he wanted to become a physician. He attended night school to complete the undergraduate science courses he needed to qualify for medical school and performed volunteer work in a hospital emergency room.

In 1973, Bakke applied for admission to the UC Davis Medical School. At age 32, and despite the accomplishments in his engineering career, he was turned down. In an exchange of letters between Bakke and a member of the admissions committee, it appears that one factor that may have been considered by several of the schools that turned him down was his age. Medical schools often consider the long-term return on their investment by calculating the number of years a graduate will likely have in the field. Bakke was nearly 10 years older than many of the applicants with whom he was competing.

The Davis Medical School had opened in 1968. There was no recorded history of racial discrimination at the school, but the faculty was concerned that in the first class, there were no African American students. As a result, they decided to initiate a special admissions program to “compensate the victims of unjust societal discrimination.” The statement in the school catalogue indicated that the program was specifically for members of “economically or educationally disadvantaged groups.” From 1969 to 1973, when Bakke applied, 26 Blacks, 30 Mexican Americans, and 12 Asians had been admitted through the special admissions program. No White applicants who applied for admission as “disadvantaged” were enrolled through the special admissions program during this same period.

The Admissions Process

By then, the size of each entering class was fixed at 100 students, and to maintain a desired level of enrollment of students from underrepresented groups, the school set aside 16 of the 100 seats for applicants from the special admissions pool. Applicants being considered for the 84 additional seats were reviewed by the regular admissions committee, but applicants who applied through the “special” program were reviewed by a separate committee. Regular admission applicants who had a

2.5 or lower grade point average were automatically rejected. However, applicants for the special admissions program could still be considered with a 2.5 average. In addition, applicants from the disadvantaged student pool could be considered for admissions even though their medical school admissions test scores (MCAT) were lower than the average for the entering class as a whole. In 1973, Davis had 2,464 applicants for 100 vacancies. When Bakke applied in 1973, the undergraduate grade point average for the special admissions program was 2.88, and the score for students in the regular admissions pool was 3.49.

Applicants for the Davis program were evaluated on a 0 to 500 scale. A variety of factors were taken into consideration in calculating this number, including grades, test scores, and the evaluation of faculty members who interviewed the applicant. Not all applicants sought or were granted an interview. In Bakke's applicant pool, about 20% of the applicants were interviewed. Bakke's initial combined score was 468, but Davis had set 470 as the cutoff score for applicants who were being reviewed in the spring of 1973. After receiving his rejection letter, Bakke decided to meet with a member of the admissions committee at UC Davis who had strong reservations about the special admissions program. That officer counseled Bakke to reapply and to keep an eye on a case from the University of Washington School of Law that seemed headed to the U.S. Supreme Court and might challenge the validity of similar special admissions programs. In effect, he counseled Bakke to consider resorting to a lawsuit against UC Davis if he was not admitted in the next class.

During the next admissions cycle, Bakke reapplied, but this time received an even lower score based on the interview that he had with a member of the admissions committee. That member, a Dr. George H. Lowery, felt that Bakke did not understand the broader social issues relating to the Davis special admissions program and that this suggested a tendency for premature judgment without full assessment of possible alternatives, traits that he felt weighed against the qualities needed to be a good physician. Nevertheless, after receiving his second rejection from the Davis program, Bakke decided to file a lawsuit claiming that he had been unlawfully excluded from the school because of his race.

State Courts Rule for Bakke

With little fanfare, the wheels were now set in motion for a monumental constitutional clash. Yet, as with many cases that eventually have national impact, this Bakke's lawyers argued that the 16 seats that UC Davis had set aside for the special admissions program constituted a racial quota that violated the California State Constitution, Section 601 of Title VI of the 1964 Civil Rights Act, and the equal protection clause of the Fourteenth Amendment. After a relatively brief trial, the court issued a split decision. On one hand, Bakke had prevailed. The court held that UC Davis special admissions program had discriminated on the basis of race in violation of the federal Civil Rights Act and the U.S. and California Constitutions. On the other hand, the court failed to order the university to admit Bakke. They instead held that the admissions process was highly discretionary and that unless Bakke could present additional evidence to show that he had specifically been the victim of fraud, unfairness, or a totally arbitrary choice by the university, the court was not prepared to order that he be admitted to the school. But they did order that he be reviewed for admission again without regard to his race. Ironically, this split at the very beginning of this case would preview the eventual split, albeit on different grounds when the case was finally concluded by the U.S. Supreme Court.

With neither side satisfied by this outcome, both issued notices of appeal. Normally, the next avenue of appeal would be to the Court of Appeals of the State of California. But due to the nature of the conflict and the fact that it was now gaining public attention, the California State Supreme Court decided to accept the appeal directly. The arguments before the California State Supreme Court were essentially the same as those initially brought in the trial court. By now, several amicus briefs had lined up on both sides of the issue, with the American Federation of Teachers filing an amicus brief in support of Bakke, and the Association of American Medical Colleges filing an amicus brief in support of UC-Davis. One group, the National Conference of Black Lawyers (NCBL), saw potential flaws in the university's defense of its program and urged the court to remand the case so that a more comprehensive factual record could be developed.

The NCBL also argued that a critical party with an interest in the case, African American medical students, were not adequately represented by the university and should have a voice in the litigation. Although this was technically accurate, Davis had invited the local National Association for the Advancement of Colored People (NAACP) to participate in the initial trial, but NAACP had declined. In hindsight, the perspectives of African American students who had faced various forms of discrimination throughout their lives and their lawyers, all veterans of years of civil rights litigation, may not have made a difference in the outcome of the case.

The California State Supreme Court was a highly respected state court bench and was considered one of the more liberal courts. In September 1976, the court issued its opinion and ruled in favor of Bakke. They held that the special admissions program at UC Davis violated the equal protection clause of the U.S. Constitution, but they avoided ruling on the California constitution and the federal statute. The admissions procedures, particularly setting aside 16 seats only for special admissions applicants, was a racial classification, and despite the university's good intentions, that practice was unconstitutional because it was not the least intrusive means of achieving its goal.

The court also held that even though the special admissions program was designed to assist members of underrepresented groups rather than harm them, it was still subject to the traditional compelling state interest test that was used whenever there was a racial classification by a state actor. This test placed a significant burden on the state to show that its racial classification was compelling, that its use of the classification was narrowly tailored to address that compelling interest and that less burdensome means to achieve the same goal had been explored and found to be unavailing. The California State Supreme Court found that the university had failed to satisfy these requirements.

However, the trial court had held that Bakke was not automatically entitled to admission simply because the program was constitutionally suspect. In a hearing of the case before the state supreme court the university decided to concede that they could not say whether Bakke would or would not have been admitted absent the special admissions program. This concession proved critical because it removed the burden of proof on this point from

Bakke, a burden that he may not have been able to meet. More critically, if he had not been able to show that his denial of admission was caused by the presence of the special admissions program, then he would have lacked standing to carry the case any further. By conceding this point, the university removed that obstacle but reserved for itself the choice to appeal to the U.S. Supreme Court.

Had they not made that concession, the case would have remained the law in California, and a different case might have been the one to make the definitive statement on affirmative action in higher education. After some consideration, the university decided to file a petition for cert to the U.S. Supreme Court appealing that portion of the decision that had declared their admissions program unconstitutional. The case was argued before the U.S. Supreme Court on October 12, 1977, but the decision was not issued until the last day of the Court's term on June 28, 1978.

By the time the California State Supreme Court had issued its decision, the *Bakke* case had attracted national attention. Debates that had raged mostly in academic journals for years over the propriety of affirmative action programs now moved to the front pages of national magazines and the editorial pages of newspapers all across the country. Discussions about affirmative action occurred on a regular basis on morning news programs. The subject of affirmative action also became a hotly contested issue on numerous college campuses, particularly those that had affirmative action admissions systems similar to the one at issue at the UC Davis campus. There were teach-ins, demonstrations, and counter-demonstrations all passionately supporting one view or the other, each eagerly awaiting the Court's decision.

The Supreme Court Ruling

The decision of the U.S. Supreme Court can be divided into three main discussions, each separate in its evaluation of the case. Four justices, led by Justice John Paul Stevens, with Warren E. Burger, Potter Stewart, and William Rehnquist, found that the special admissions program violated the non-discrimination requirements of Section 601 of Title VI of the Civil Rights Act of 1964. Having reached that judgment on statutory grounds, they saw no need to also rule on whether it also violated the

Fourteenth Amendment. Justice Lewis Powell agreed with them as to the unlawfulness of the program but held that the case should be decided on the constitutional grounds, which he found that UC Davis had also violated. Justice William J. Brennan Jr. was joined by justices Byron R. White, Thurgood Marshall, and Harry A. Blackmun dissenting. They held that the program was constitutional and that race could be used by the university in its admissions programs to address the effects of past discrimination in society.

The Powell Analysis

Justice Powell agreed with the dissenters that race could under certain circumstances be constitutionally employed in admissions but found societal discrimination to be an unworkable justification. Instead, he wrote at length about how a university could carve out a narrow exception to normal equal protection jurisprudence and found support for his view in the importance of diversity in a student body for “the robust exchange of ideas,” which was based in part on the First Amendment. So, by a vote of 5 to 4, the Davis admissions program was held to be unlawful. Ironically, while Justice Powell agreed only in part with the dissent, his opinion has often been read as if it were in fact the opinion of the dissenters and thereby constituted a fifth vote in favor of the dissenting views. In reality, the four dissenters said very little about Powell’s opinion.

Justice Powell began by first addressing the Title VI issue. Since the California State Supreme Court had based its decision on the Fourteenth Amendment to the U.S. Constitution, neither of the parties had addressed the Title VI issue in oral arguments. After subsequent briefing, two separate issues emerged. One was whether Title VI provided for a private cause of action or alternatively was only enforceable by the government. The second was whether Title VI and its prohibition against discrimination should be read as encompassing essentially the same protections and prohibitions as the equal protection clause of the Fourteenth Amendment.

Powell found it unnecessary to address the first issue since it was not decided by either of the two courts below. On the second issue, he found that “in view of the clear legislative intent, Title VI must be held to prescribe only those racial classifications

that would violate the equal protection clause or the Fifth Amendment.” On this point, Justice Powell was in agreement with the Stevens, Burger, Stewart, and Rehnquist group. But the real focus of Powell’s opinion was on the application of the equal protection clause to the Davis affirmative action admissions program.

The university had argued that the normal strict scrutiny standard for review of racial classifications should be reserved for laws that disadvantaged “discreet and insular minorities,” *United States v. Caroline Products Co.* (1938). Powell rejected this argument and similarly rejected the idea that distinctions should be made based upon whether a racial classification constituted a goal or a quota. He found that as long as the distinction was based upon race, those labels were merely semantic differences. The equal protection clause, he concluded, cannot mean one thing when applied to one individual and something else when applied to a person of another color. He noted the Court’s historical disfavor of any form of racial classification and the carefully developed review standard that required a compelling justification in any use of race.

His rationale recognized that the original framers of the Fourteenth Amendment conceived of it as a means to bridge the vast political and economic distances between “the Negro race and the White majority” that flowed from enslavement. But he argued that the nation had changed considerably since the enactment of the Fourteenth Amendment. We are, Justice Powell urged, now a nation of various groups, and in his view, the concepts of “majority” and “minority” reflected temporary arrangements and political judgments. On this basis, he concluded that there was no principled way to decide which groups would merit heightened judicial review and which would not.

In this part of his argument, he was specifically responding to the dissenting opinions authored by Justice Brennan and Justice Marshall. He further added that it would be too difficult to determine whether a racial classification was invidious or benign, making the more flexible standard of review urged by the dissenters impracticable. He added that it is the individual who is entitled to judicial protection against racial classifications, not groups, and that because of the long history of the misuse of racial classifications that strict judicial scrutiny of all forms of racial classifications is warranted.

Further, he concluded that courts or even legislative bodies will continue to be free to use racial classifications as a remedy for specific forms of discrimination, as they have for example in the many school desegregation cases that the Supreme Court had decided. The state, he argued, has a legitimate and substantial interest in eliminating the disabling effects of identified discrimination. But, the record of this case reveals that the university did not make an effort to establish such findings and that its broad mission was education, not the fashioning of legislative policy or adjudicating claims of illegal discrimination.

At this point, Justice Powell had carefully dismissed three of the four rationales offered by the university for the special admissions program. However, it was the fourth rationale that became the cornerstone of his opinion. The university claimed that there were specific benefits that flowed from an ethnically diverse student body. Justice Powell found this to be a constitutionally permissible goal for an institution of higher education. He found its justification not simply in the Fourteenth Amendment, but in the First Amendment, which provides a broad umbrella under which the robust exchange of ideas within a university setting should receive special consideration. He cautioned however, that while race could be used as one of several factors that a university might consider in the admissions process, the university must be careful not to make it the controlling factor lest it fall on the impermissible side of the constitutional line. He referred to this use of race as a “plus” factor. And it was here that he attached an appendix describing the admissions policies at Harvard University, where the methods that he found constitutionally permissible were described in detail.

Other Justices Respond

Justice Brennan, long known as one of the most astute consensus builders on the Supreme Court, wrote a very carefully worded dissenting opinion that made clear that while he and Justices Marshall, White, and Blackmun held a different constitutional theory for the Fourteenth Amendment, there were particular points in the case where they agreed with Justice Powell. They agreed that Title VI of the Civil Rights Act of 1964 should be

applied in the same manner as the equal protection clause of the Fourteenth Amendment. They also agreed that the particular affirmative action program used by UC Davis was constitutionally suspect and violated Title VI and therefore found that Bakke should be admitted to the medical school. But Justice Brennan also pointed out that the four dissenters agreed that the future use of race in admissions programs was not unconstitutional per se. While they disagreed with Justice Powell on the theory that would support this conclusion, they reiterated that it was a conclusion that commanded five votes. This, they argued, had the effect of overturning the decision by the California State Supreme Court that would have prohibited the university from establishing future affirmative action programs that take race into account.

Having established that both Title VI and the equal protection clause should be applied in a similar fashion, the Brennan group went on to argue that, based upon the legislative history of Title VI as well as the equal protection clause, the clear intent of both of these laws was to produce effective remedies for the historical discrimination that Blacks had faced. Recognizing the theoretical problem that this position posed, he argued that rather than giving universities an almost free hand in experimenting with affirmative action, the Court should instead resort to a middle-tier level of judicial scrutiny, similar to that provided for classifications based upon gender. Thus, the Court would exercise a significant degree of oversight while at the same time providing colleges and universities with some flexibility in fashioning their admissions policies. While this theory was well argued by Justice Brennan, it failed to gain that crucial fifth vote that would have dramatically changed the outcome of the *Bakke* case. Although Brennan and Marshall pursued this same theory in several subsequent affirmative action cases, it was never able to gain much constitutional traction with the exception of a brief application in the *Metro Broadcasting Inc. v. Federal Communications Commission* (1990), whose permissive standard of minority preferences was expressly overruled in *Adarand Constructors, Inc v. Peña* (1995).

Justice Stevens authored the third corner of this triangular opinion. He reasoned that since the trial court had based its decision in part on Title VI, the Court should rely on a well-settled practice to

avoid the decision of a constitutional issue if the case can be fairly decided on statutory grounds. He said, "We ought not to pass on questions of constitutionality unless such adjudication is unavoidable." He then went on to argue that based on the plain language of the statute, Bakke had in fact been the victim of discrimination based upon race, which Title VI specifically prohibited. The remainder of his relatively brief opinion took issue with the Brennan group on whether or not the language of Title VI permitted certain types of racial classifications but not others. He concluded that it did not. However, he also added that this case did not require the Court to decide on the congruence, or as he pointed out, lack of congruence between the federal statute and the Constitution. The Stevens group therefore agreed with the State Supreme Court of California insofar as they affirmed the trial court's judgment that Title VI had been violated but added that "to the extent that it purports to do anything else, I respectfully dissent."

Impact of the Ruling

The divided court in the *Bakke* case was in some respects a mirror of a nation divided on this crucial issue. Polls suggest that while a majority of those surveyed disapprove of racial quotas, a slim majority still supports some form of affirmative action. When Justice Powell retired from the Court, he referred to his decision in the *Bakke* case as one of the most important that he had written as a justice of the Court. In retrospect, it was in many ways an astute political decision as well as legal statement. While placing clear limitations on the practice of affirmative action, he nevertheless carved out a small constitutional niche that has not only survived but also has been vindicated more recently by the Supreme Court's decision in the case of *Grutter v. Bollinger*. In fact, Justice Sandra O'Connor's majority opinion in the *Grutter* case is very close to Justice Powell's decision in *Bakke*. But, as Justice Powell noted, times have changed, and Justice O'Connor's decision in *Grutter* contains the prediction that within 25 years affirmative action in higher education should no longer be necessary.

After his victory before the U.S. Supreme Court, Bakke entered the UC Davis Medical School and graduated in 1982. He moved from

California back to Minnesota where he practiced anesthesiology until 2003, when it is reported that he retired from active medical practice.

Justice Powell's decision arguing for race as a mere plus factor in university admissions has been the legal cornerstone for those programs up until 2003, when essentially the same rationale was upheld by the Supreme Court in the *Grutter* case. Since 1978, students from underrepresented groups have shown significant progress in high school graduation rates and in college matriculation, though they still lag behind their White counterparts in overall college enrollment. The degree to which this success can be attributed to affirmative action programs in higher education is difficult to measure. It is safe to say, however, that particularly at the most selective colleges and universities, without affirmative action programs both the numbers and percentages of students from underrepresented groups attending those institutions would have been significantly lower than they are now.

However, affirmative action is by no means on solid judicial ground. Neither *Bakke* nor *Grutter* required colleges to implement affirmative action programs. Both merely permitted these programs so long as they were carefully crafted. Yet, the states of California, Washington, and Michigan have passed referendums prohibiting all state institutions from taking race into account in hiring, promotion, or college enrollment. Finally, while the enrollment of students from underrepresented groups in medical schools has remained flat over the past decade, communities of underrepresented peoples, particularly those in the inner cities, remain chronically underserved by medical facilities.

RELIGIOUS-BASED EDUCATION

Free and enslaved African Americans avidly supported efforts to educate themselves during enslavement and after the Civil War. After emancipation, White Christian benevolent societies offered sporadic assistance to newly freed African Americans. The contemporary legacy of religious-based education finds Christians and Muslims sponsoring pedagogical innovations for African American education. Historically, religious-based education for African Americans always required educative reforms. With the shift in focus from adult education in the 19th century to primary and secondary education in the 21st century, the legacy of African American religious-based reforms secure the heritage of African American pride and self-reliance in academic excellence. This entry looks at that history.

Before the Civil War

During the colonial period, White Christian churches aborted their opportunity to serve as emancipators. In 1784, White Methodists denounced enslavement and gave ministers 12 months to liberate their enslaved Africans. Baptists denounced enslavement 5 years later. This bright promise of Christian liberty soured as Christian enslavers determined that an educated enslaved African was no longer a precious commodity but a future runaway or potential insurrectionist.

The Anglican missionary organization—the Society for the Propagation of the Gospel in Foreign Parts—founded schools in Charleston, South Carolina (1742–1764), and New York City (established by Frenchman Elias Neau). By 1746, the Charleston school had educated 28 children and had 55 more registered for daytime instruction, in addition to 15 adults enrolled in night school. In 1714, Puritan leader Cotton Mather opened a school for Indians and African Americans in Boston. Instruction by these schools was severely limited, teaching the enslaved how to read only the scripture and catechism. Although the mission schools gave a minority of African Americans an academic toehold, the schools were tainted by a race hatred that mandated the creation of independent schools by African Americans.

Rejection by enslaving Christians spurred African Americans in the North to seek their own alternatives. Free Africans established Free African improvement societies, which supplemented the meager institutional support for the African American community. Worship, education, burial service, and insurance were critical services and concerns for the African societies. Their pedagogy presented a positive image of African history and taught emerging African American leaders how to resolve problems and use collective action.

African American clergy moved swiftly to open schools for children and adults. The first New York African Free School was instituted in 1787 under the leadership of Rev. Theodore S. Wright, John B. Russwurm, Edward Mitchell, William Brown, William G. Smith, and Edward Jones—all African American and all college graduates. Their goal was a liberal education for boys and girls. Reminiscent of Prince Hall, who opened a school in his home in 1798, Rev. Richard Allen, national leader of the African Methodist Episcopal (AME) Church, opened a day school for African American children and a night school for adults. By the 1800s, African American benevolent societies and church-based groups such as the African Friendly Society of St. Thomas, United Brethren, and the African Female Band Benevolent Society of Bethel, were just 3 of the more than 40 such organizations in Philadelphia between 1795 and 1830. They supplemented efforts by the fledgling public school system in the North with study circles and reading groups that were heralded worldwide.

White Congregationalist colleges in New England produced the first African American graduates. Alexander L. Twilight at Middlebury College, Vermont, in 1823 was the first. Edward A. Jones, Amherst College, Massachusetts, and John B. Russwurm, Bowdoin College, Maine, followed in 1826. Lemuel Haynes was awarded an honorary degree from Middlebury in 1804 and was the first African American minister to be ordained by a predominantly White denomination in 1785.

Church-related Black colleges were founded by African American clergy right before the Civil War. Wilberforce University, chartered in 1856 by the predominantly White Methodist Episcopal Church, had four African Americans on its 24-member trustee board. One was AME Bishop

Daniel Alexander Payne, who later orchestrated the purchase of the school by the AME Church in 1863. Payne served as president of Wilberforce until 1876. At the same time, Lincoln University in Chester County, Pennsylvania, was another church-related Black college set up by White Presbyterians. Incorporated in 1854 as the Ashmun Institute, Lincoln matriculated its first students in 1856.

After the Civil War

African American churches were often the first sites for African American institutions of higher learning. Morehouse College in Atlanta, Georgia, traces its history to a school founded in 1866 in the basement of the Springfield Baptist Church in Augusta. Spelman College started in the basement of the Friendship Baptist Church in Atlanta, while Tuskegee, under the direction of Baptist Booker T. Washington, first convened in the basement of Butler Chapel AME Zion Church in Tuskegee, Alabama.

Autonomous efforts by these few colleges and self-taught enslaved Africans spurred religious efforts to educate the previously enslaved during and after the Civil War. Slave codes of the 1820s and 1830s forbade anyone to teach an enslaved African to read or write. Some White denominations, such as the Disciples of Christ of North Carolina, made a public commitment to teach their charges to read in order to learn the scripture in spite of the law. African American preachers often taught their members reading secretly, with catastrophic results. If discovered, they could be fined, publicly whipped, or killed. The sacrifice of literate African American preachers anchored the burgeoning free church tradition in the South by encouraging enslaved Africans to read the Bible and memorize scripture. Their efforts encouraged freed men and women to start schools for children and adults in the postbellum years.

At the end of the Civil War, White northern churches and philanthropic societies aided the newly freed men and women by sending missionaries, social workers, and teachers. The leading organization was the American Missionary Association with missionaries from the Congregationalist Church, the New England Freedmen's Aid Society, the Pennsylvania Freedmen's Relief Association, the National Freedmen's Relief Association of New

York, and the Friends Association for the Aid and Education of Freedmen. Workers were also commissioned by the Western Freedmen's Aid Commission, the United Brethren in Christ, the Northwestern Freedmen's Aid Society of Cincinnati, the Assembly of the Presbyterian Church, the Freedmen's Aid Society of Chicago, the Board of Missions of the United Presbyterian Church, the New York Society of Friends (Quaker), and the Reformed Presbyterians.

Education by the Quakers was an exception to the common enslaving mentality. Their early commitment to educating enslaved Africans began with a school opened by Anthony Benezet in Philadelphia, which had more than 400 pupils by 1813. Quakers from the Midwest and New York sent missionaries to teach and, when allowed by southern White citizens, to build industrial schools. Quakers aligned themselves with whoever would work with them, such as the African American soldiers of the 56th Regiment, who built an industrial school in Helena, Arkansas, in 1866.

Presbyterians, Methodists, American and Freewill Baptists, Unitarians, and Congregationalists combined their school building projects with church building. White Methodists were especially adept at securing funds from the Freedmen's Bureau to repair churches that housed or adjoined schoolhouses for freed men and women. Baptists, Presbyterians, and Methodists diligently educated southern African American ministers, because they rightly assumed that their investment would guarantee stronger congregations. Although efforts by the American Missionary Association promoted the establishment of a well-defined public school system throughout the South, the legacy of religious education and equal educative benefits for African Americans faded with the expansion of Jim Crow in the 1880s.

The Civil Rights Struggle

In the 20th century, African American civil rights activists from the African American church emerged to challenge the industrial school model of vocational training fostered by Booker T. Washington. Instead, African American denominations maintained the legacy of historically Black colleges begun in the 1800s and looked for the end of segregation

to introduce proper facilities and staff for African American students. By 1915, African American churches had acquired more than \$2 million in school property. Leaders at the forefront of the Black college and seminary movement were (in descending order) Baptist, the AME Church, the Colored Methodist Episcopal Church, followed by White-sponsored Black colleges founded by the United Methodists, Presbyterians, the Episcopal Church, Disciples of Christ, and United Church of Christ.

In spite of civil rights legislation of the 1960s, full educative rights for African Americans remained yet elusive. The alternative of African American students' attending Catholic parochial schools waned in the 1990s, with school closings caused by low inner-city rolls and high tuition. Disappointment in the public school system stirred African American Christians and Muslims to seize the reins of self-determination by starting parochial and charter schools of their own in the 1990s.

African American Christians developed holistic ministries that continued into the 21st century. These ministries promote self-improvement in areas of health, HIV awareness, and General Educational Development (GED) preparation. African American churches bolster public schools through adopt-a-school programs or establish day care centers and Christian academies. By 1996, the independent school movement produced 400 independent Black schools, with more than half religiously affiliated or started by a church. Baptists, AME, United Methodist, and Catholic churches led the trend.

Muslims joined the independent school movement in earnest in the 1970s. By 1991, the American Muslim Mission (formerly the Nation of Islam) had 38 Sister Clara Muhammad primary and secondary schools in major cities across the United States. In addition to the standard curriculum, these schools offer Arabic and intensive courses in African and African American history. The Council of Islamic Schools of North America and the Muslim Teachers College workshops train and prepare teachers in this pedagogy.

REPARATIONS

The issue of reparations has been a very important one for African Americans. In light of the enslavement of African Americans and the continued oppression of those people following enslavement, the argument has been put forth in many arenas for the reparations for African Americans from the U.S. government. This is a legitimate request, many argue, given the reparations given to other groups. This discussion and the implications thereof are an important part of the education of African Americans today.

The United States enacted and implemented a reparation program under the Civil Liberties Act of 1988 for Japanese and Aleuts. No such program in the United States has been prepared for African Americans.

A statement of the criminality of enslavement was made by President George W. Bush on July 8,

2003, when he visited the enslavement chamber on Goree Island in the Republic of Senegal, West Africa. Despite President Bush's knowledge of the crime of genocide against the ancestors of today's African Americans, he did not provide assistance when three board members of the National Coalition of Blacks for Reparations in America (N'COBRA), founded in 1968—Imari A. Obadele, Kalonji Tor Olusegun, and Kuratibisha X Ali Rashid—requested that the U.S. attorney general of the United States provide the same benefits of the Civil Liberties Act of 1988 to African Americans as provided to the Japanese. The attorney general turned down this equal-protection-of-the-law request on grounds that the three requestors were not Japanese.

In September 2003, this equal protection case was filed before the U.S. Supreme Court, asking for a *writ of certiorari* (a request that the Court hear the case). It was accompanied by a letter from the National Bar Association President Clyde E. Bailey Sr. asking President George W. Bush and Solicitor General Theodore B. Olsen to review and agree to support this case on the basis of the Bar Association's resolution of support. They did not agree to support the case, and the Supreme Court denied the request for the certiorari. The following year, when lawyers Charles Ogletree and Adjoa Aiyetoro took a case concerning the 1921 mob destruction of "Black Wall Street" in Tulsa, Oklahoma, the Supreme Court again denied certiorari.

A predominantly African American town in Florida, known as Rosewood, was destroyed by a White mob that began murdering and destruction on New Year's Day 1923. In the mid-1990s, a Florida Legislative Commission studied the destruction and issued a 93-page report, finding that the county sheriff took no substantial measures to protect the people. In 1995, nine survivors received \$150,000 each from the state. Sixty to 70 other victims received \$145 to \$5,000 each.

Reparations for African Americans continues to be viewed by many as important, particularly in light of compensation given to other groups and the reality of the above-cited cases of victimization of African Americans.

RESEGREGATION

A trend toward greater racial desegregation in U.S. public schools, set in motion by landmark U.S. Supreme Court rulings declaring segregated schools unconstitutional, began to reverse direction in the first decade of the 21st century. Recent Court rulings have restricted the use of race in desegregation plans and ended districts court-ordered busing arrangements. These legal trends, coupled with residential patterns in which African Americans and Latinos are often isolated, have led to increasing resegregation in public schools. These trends have important implications for African American students, who, research shows, made greater progress both academically and socially in desegregated schools. This entry looks at the history of segregation, desegregation, and resegregation.

Moves Toward Desegregation

Although judicially permissible school segregation emerged in the United States as early as 1850, legal scholars point to the U.S. Supreme Court decision in *Plessy v. Ferguson* (1896) as the legal milestone that promoted racial segregation in trains, restaurants, restrooms, and classrooms. In *Plessy*, the Court ruled that as long as separate facilities for African Americans and Whites were "equal," these segregation practices did not violate the equal protection clause of the Fourteenth Amendment to the Constitution. School segregation policies prevailed for more than 50 years following *Plessy*, until local activists and attorneys with the National Association for the Advancement of Colored People (NAACP) fought to end racial segregation and to equalize educational facilities and opportunities for African American children.

In the early 1950s, the U.S. Supreme Court heard a series of school segregation cases, the most notable being *Brown v. Board of Education of Topeka* (1954). The *Brown* unanimous opinion set the stage for racial desegregation in U.S. public schools, striking down the use of race as a constitutionally permissible (de jure or based on law) mechanism to segregate African American and White children. The promise of *Brown* took more than 20 years to be realized fully—partly as the result of organized resistance among elected officials and education leaders in the South that was exacerbated by the famously ambiguous directive in *Brown II* (1955), in which the Court instructed states and school districts to “move with all deliberate speed” to dismantle their dual (or separate) educational systems.

Nonetheless, the Court’s 1954 decision produced a series of significant shifts across the landscape of U.S. public education. The aftermath of *Brown* is best measured in the impressively large academic gains made by African American students following the dismantling of segregated systems in the 1970s and 1980s—the height of desegregation activity in U.S. schools nationwide—and in the move toward more positive racial attitudes, increases in college attendance among African American students, and in the drift toward greater residential integration. In a subsequent landmark legal opinion, the U.S. Supreme Court ruled in *Swann v. Mecklenburg* (1971) that districts could implement crosstown busing and student reassignment strategies to ameliorate the combined effects of segregated housing patterns and neighborhood school attendance zones (known as de facto segregation).

Although most of the research on the effects of desegregation has focused upon academic outcomes, more recent studies have explored the social outcomes of desegregated school settings. Research in developmental psychology has documented the social and developmental benefits of intergroup contact and school diversity. These research findings suggest that school diversity leads to positive social interactions, and those interactions lessen stereotypes among racial groups. Additionally, research concludes that students who reported they have more contact with people of other racial groups demonstrated more tolerant and inclusive viewpoints about racial and ethnic inclusion than

did students who had less interracial contact. Overall, these findings suggest that school contact between youth from different groups, including cross-race friendships, corresponds with more positive intergroup attitudes.

Emergence of Resegregation

The degree of cross-racial exposure in public schools has declined since the 1990s, as a pronounced pattern of resegregation has emerged with increased momentum. Resegregation is continuing to grow in all parts of the nation, but it is accelerating most rapidly in the South. Researchers assert that U.S. schools are resegregating due to changes in the racial composition of neighborhoods and in response to the end of court-ordered desegregation plans, known in legal terms as a “grant of unitary status.” Resegregation trends are evident in the most recent public school data (2005–2006) reported by the U.S. Department of Education. These data indicate that African American and Latino students are slightly more isolated—or segregated—from White students than they were in 1993–1994. Approximately 3 out of 10 African American and Latino students attended schools in 2006 in which fewer than 5% of the students were White. White students, in contrast, are slightly less segregated or less isolated from African American and Latino students than they were earlier. The explanation for the decrease in White student segregation rests with the surge in Latino student enrollments as a percentage of the total public school population. Still, Latino students are the most segregated racial group, followed by African American students.

This pattern of resegregation is expected to expand in light of the most recent and most significant ruling on race in education since the landmark *Brown* decision in 1954. In *Parents Involved in Community Schools v. Seattle School District No. 1* (2007), the Court struck down the use of race in student assignment plans designed to achieve racial desegregation. This ruling may signal the practical end to decades of district policies that use race—even if used voluntarily—to achieve racially diverse schools.

The implications of the Court’s majority opinion pivot on the conditions that persist in the absence of racial desegregation (or diversity) plans.

Racially segregated schools for African Americans students often translate into isolated, high-poverty schools in which there are a higher proportion of inexperienced teachers, a higher turnover among teachers and students, more limited curriculum and educational resources, lower average achievement and higher dropout rates.

In response to a flurry of legal opinions in the past decade hostile to the use of race in student assignment plans and student choice programs (for example, magnet schools) except under the most “narrowly tailored” conditions, some districts have moved to using socioeconomic status as mechanism for maintaining diversity in schools. Wake County, North Carolina, is a notable example, where students are assigned to schools based upon household income or poverty status. The district’s student assignment plan is pegged to a cap on the school poverty rate at 40%, as measured by participation rates in the free and reduced-price lunch program at each district school. The success of this diversity strategy, however, depends upon the density of poverty in a district. The Wake County poverty rate is a relatively low 24%, making the 40% cap attainable and producing a pattern of both racial and socioeconomic integration. In most urban school districts, the rate is much higher, rendering the goal of socioeconomic integration—or racial desegregation—unreachable.

RIDDICK V. SCHOOL BOARD OF THE CITY OF NORFOLK

The national resegregation movement began with a little-known case resolved in the Fourth Circuit Court of Appeals, *Riddick et al. v. School Board of the City of Norfolk, Virginia* (1986). In 1986, the U.S. Supreme Court refused to hear the case, but the strategy employed by the attorneys in *Riddick* took on a life of its own. Exploiting the notion of unitary status—the dissolution of dual school systems—and capturing the support of an ineffective Justice Department, attorneys for the School Board of the City of Norfolk employed an approach that served as the impetus for disassembling desegregation efforts. Pledging support for diversity and touting the progress made since the end of massive resistance in the Norfolk, the board successfully avoided court oversight, promised a reversal of White flight trends, and resegregated 12 elementary schools by both race and class. Since *Riddick*, schools throughout the South have found ways to dissolve or dilute diversity initiatives using unitary status. Districts have been released from court oversight by becoming partially or fully unified

and reverting to pre-desegregation activities with little difficulty.

Historical Context

Norfolk, Virginia, was in a unique position with regard to desegregation issues, for which complex remedies were sought. The primary revenues for the city were for the most part linked to the U.S. Navy. Norfolk lay in a region of the nation called Tidewater that housed the largest naval installation in the world. While the armed services were desegregated in the early 1940s, Virginia considered race mixing taboo and rejected any efforts to desegregate public facilities, including schools. After the war, former Navy housing turned over to Norfolk Redevelopment and Housing Authority (NRHA) was used to house many low-income families. The NRHA use of the property had left Norfolk with pockets of African Americans in neighborhoods surrounded by Whites. African American students living in these areas were physically closer to White schools, and before *Brown*, parents were responsible for transporting children to the African American schools nearest their homes.

Desegregation litigation in Norfolk began one year after the *Brown II* decision. Fearful of the obvious mandates of *Brown I* and *Brown II*, city leaders determined the apparent threat of mandated desegregation possible with a favorable resolution for plaintiffs in *Beckett v. School Board of the City of Norfolk* (1956). The case involved students living in the Atlantic City area of the western quadrant of Norfolk who lived closer to two all-White schools. Norfolk leaders, in cooperation with NRHA, condemned homes in the area and closed two schools to avoid the required desegregation. In addition, Norfolk built “vest pocket” schools. The vest pocket schools were small, and they were built so quickly that gymnasiums, cafeterias, or normal school structures associated with education were left out of the facilities. The schools were located closest to African American neighborhoods, sometimes across the street from White schools serving the same age group, to avoid the proximity mandates of the *Brown* decision.

From 1956 to 1971, Norfolk public schools fought any form of mandated desegregation. Such extreme disdain for race mixing had left 10,000 White students out of school from September 1958

to February 1959. Transfer applications of 38 African American students to attend the White schools closest to their homes had prompted the redrawing of district attendance lines and more “vest pocket” schools, illegal use of test scores as a qualifier for transfers, and threats of violence to African American families. After every possible strategy was applied to avoid desegregation, 17 African American students still qualified for transfers. It was at that point that the Senator Harry F. Byrd’s strategy of massive resistance was employed in Norfolk. This method involved closing the schools and selling the property to private interests with the caveat that the private schools would remain segregated. For 6 months, six all-White junior high and high schools were closed to prevent African American student attendance. Business and community leaders realized that the destruction that would result relative to the fragile military-based economy was much more important than blocking the 17 African American students and pushed for reason to prevail. The schools opened and the Norfolk 17, as the students were called, began their educational experiences in the hostile school environments.

The need for covert methods of segregation appeared to be more appealing to Norfolk leaders, and the struggle continued to avoid desegregation though the courts. Norfolk leaders claimed that though de jure segregation in housing had ended, the de facto segregation in housing prevented the reasonable redrawing of district lines. The 1971 ruling in *Swann v. Charlotte-Mecklenburg Board of Education* eliminated Norfolk’s former excuses, and a court order forced the city to develop a cross-town busing plan that would provide racial balance in Norfolk’s K–12 schools. The plan was implemented in the fall of 1971, and for the next 12 years, Norfolk schools were desegregated. Three fourths of the city had a full busing plan, and the most affluent portion of the city in west Norfolk used a choice option. After the election of President Ronald Reagan, conservative leaders in Norfolk began to push for an end to court supervision of formerly segregated schools. The leaders found that a sympathetic justice department and a supportive presidential administration created a positive atmosphere for persons opposed to desegregation. Recommending that the busing plan be ended for elementary schools, the school board chair found

little resistance, as he was only opposed by only two African American school board members. When public hearings began on the issue, an African American businessman, Paul R. Riddick, spoke passionately against the plan. The school board and the city attorney were so angered by the audacious young African American man that the two parties attempted to sue Riddick. Enraged and insulted by the show of White hegemony and the attempts to intimidate him, Riddick and several other African American parents filed a lawsuit themselves.

Facts of the Case

In July 1971, when Norfolk's busing plan was instituted, the population of the city was 307,951, with 70% (215,096) White and 28% (87,261) African American. The public school population was 56,830, with 57% (32,586) White students and 43% (24,244) African American students. By 1983, the city population was 266,979, with 61% (162,300) White citizens and 35% (93,987) African American citizens. During the 12-year period, the racial population of Norfolk schools had shifted, and 58% (20,681) of the students were African American and 42% (13,327) were White. In 1970, there were 54 elementary schools, and in 1983, there were only 36 elementary schools. The city had lost 37% of the overall school enrollment. Norfolk claimed that the loss of the White population and the White students and parent-teacher association members resulted from mandatory desegregation through crosstown busing.

The plaintiffs argued that a proposed plan to end crosstown elementary school busing in Norfolk for children in Grades K-6 for the purpose of desegregation was racially motivated. Riddick and other African American parents involved in the lawsuit claimed that implementation of the proposed plan would violate the rights of the plaintiffs under the Fourteenth Amendment. The plaintiffs also argued that the proposed plan would have the effect of creating 12 resegregated elementary schools. The proposed plan was adopted by the school board on February 2, 1983, and was scheduled to be implemented in September 1984.

Norfolk's proposed plan would involve a release from court oversight and recognition of unitary status based on the factors identified in *Green v. New Kent County* (1968), resolved earlier with the

verdict in the 1975 *Beckett* decision. The plan also involved the dissolution of busing for elementary-age students in grades K-6 and a provision for students to attend *single-zone districts* or *neighborhood schools* (a term popularized during the massive resistance era). Norfolk city schools acknowledged that the plan would involve an increase from 7 to 12 racially identifiable schools or schools with more than 70% single race configurations. To counter the concern over the creation of more segregated schools, a plan for majority/minority (M/M) transfers was devised. Under the proposed plan, a student who held majority status in a neighborhood school with a 70% or more majority population could choose to transfer to a school that had a population of 50% or less of that majority. The school administration predicted that in year one of the plan, 10% to 15% of those eligible for M/M transfers would use the option. The board also contended that within the next 5 years, 30% to 40% of the eligible students would participate in the M/M process. After M/M transfers were considered, only one school, Bayside Elementary, would be more than 70% White.

Impact of the Ruling

Riddick plaintiffs lost the case at the district level in 1984, with the court noting the willingness of the school board to accept the proposed plan and the district's prior attainment of unitary status. The attainment of unitary status, according to the court, signaled an end of segregation in the district. An appeal to the Fourth Circuit Court of Appeals was lost as well. The case was closed when the U.S. Supreme Court in 1986 refused to hear *Riddick*.

The district's attainment of unitary status served as a license to return to pre-desegregation behaviors. When fully implemented, the proposed plan resulted in the resegregation of 12 African American and 6 White elementary schools, with a population in 10 African American schools that ranged from 97% to 100% African American. Further, subjective measures employed to determine approval or disapproval of M/M transfers and the choice plan for Ghent Elementary School in west Norfolk provided little relief. To pacify parents and concerned board members, a "playdate" type program was established to voluntarily bus children to afterschool programs to

foster race mixing. As predicted, the program failed miserably. Additionally, with the exception of one school, Bowling Park Elementary (99% African American), student performance in the segregated African American schools plummeted.

It is important to note that the district's move to resegregate elementary schools was accomplished after the district hired its first African American superintendent. After hiring the district's second African American superintendent, Norfolk reseggregated its middle schools. The second superintendent publicly indicated a lack of support for the board proposal.

Of greatest significance in the matter of *Riddick et al.* was the use of unitary status as a means to avoid court oversight. Achieving unitary status was the goal to which districts aspired in the struggle against desegregation. Unfortunately, the term now describes districts that have used the privilege of unitary status as a tool to resegregate public schools.

rites of passage programs

The rites of passage process (preparation, separation, transition, and reincorporation) is the fundamental process through which human development and social integration take place. The rites of passage process is a structured system of rituals, symbols, and ceremonies developed to aid initiates to successful transition from one stage of life to another. The rites of passage process is the social and cultural foundation in which the basic tenets of the modern formal educational process are rooted. This entry describes the process and the programs for African Americans that have been developed according to this model.

General Description

The primary purpose of the rites of passage process is to transfer the collective cultural wisdom of a people to the members of the group. The rituals and ceremonies provide metaphors for the philosophies and values that shape that society. These structures are arranged typically to correspond with stages of life (that is, birth/naming, puberty, adulthood, marriage, elder, and death), states of consciousness, or membership as defined by the society or group. The function of the rites of passage process is to provide a sociocultural context in which active “meaning making” can take place to foster personal development and group cohesion.

Arnold van Gennep coined the phrase rites of passage in his book *Les rites de passage* (*The Rites of Passage*) published in 1908, in which he describes rites of passage rituals as divided into three stages: preliminary, liminal, and postliminal. *Les rites de passage* was highly influential. As an anthropologist, van Gennep was concerned with identifying the rituals (rites) that were unique to specific cultural groups and the significance associated with

such rituals. However, as scholars concerned with education and cultural transmission applied the rites of passage concept, the preparation stage was identified as the first stage of the rites of passage process (see Figure 1). The four stages can thus be described as the following:

1. *Preparation*. In this stage, the participants learn the basic skills and responsibilities associated with the new status to which they hope to transform.
2. *Separation (preliminary)*. This change is accomplished by separating the participants from their usual social setting. In this stage, the participants are tested and seek approval from the elders.
3. *Transition (liminal)*. This is the period during which one is “betwixt and between,” “neither here nor there.” This is the stage in which the ceremony to mark the transformation takes place. It is often the most outwardly ritualized and symbolic.
4. *Reincorporation (postliminal)*. This is a stage during which one’s new social status is confirmed, and one has the rights, privileges, and responsibilities associated with the new status.

The successful completion of the former process is the prerequisite for the next level of development. Thus, it serves as the preparation for the next process. The rites of passage process is an ongoing experience, not an event.

While the rites of passage process is universal to the human experience, the rituals, symbols, ceremonies, values, and the subsequent development make sense only within their cultural context. For example, both the Maasai and Jews

have an adulthood initiation rite of passage that follows the basic process of preparation, separation, transition, and reincorporation. However, the rituals and ceremonies of each group are not interchangeable. The bar or bat mitzvah makes sense only within the Jewish context, and the Maasai rituals and ceremonies make sense only within their own context. Likewise, any use of the rites of passage process must be specifically situated within the experiential and cultural context of the initiate. It is the continuity between cultural heritage and personal development that makes the rites of passage process so transformative and aids in building cohesion among a group.

The rites of passage process is so fundamental to the human experience that it is one of the first processes attacked by an oppressor seeking to subjugate a group of people. Be it the experience of Africans in the Americas, the Aborigines of Australia, the Indigenous peoples of the Americas, or the systems of colonialism and apartheid in Africa, whenever there is a group seeking to institutionalize its power over another group, the rites of passage process of the oppressed is disaffirmed. Rituals, symbols, and ceremonies that were metaphors for the values and philosophies rooted in the collective cultural wisdom are replaced with rituals, symbols, and ceremonies that reinforce the circumstance of the oppression.

It is this strategy to which African American educator and historian Carter G. Woodson refers in his famous quote in *Mis-Education of the Negro*: “If you can control a man’s thinking, you do not have to worry about his action.” Therefore, when the oppressed seek to liberate from oppression, they will seek to restore the rites of passage process to the original cultural roots, even if the rites of passage model is not discussed explicitly.

Figure 1 Rites of Passage Process

African-Centered Rites of Passage

One of the early calls for resocialization was articulated in *David Walker's Appeal* (1830). Though Walker does not explicitly call for new educational alternatives for African America people, he is clearly suggesting that African Americans must not succumb to the schooling provided by “White Americans” but must

find a way to educate themselves in light of the African arts, sciences, and philosophies. In the early part of the 20th century, scholars and activists like W. E. B. Du Bois, Carter G. Woodson, and Marcus Garvey furthered the concept. Though an African-centered rites of passage process was not identified by name, the need to resocialize the “negro” and to center a sense of self and community around African principles and heritage was made clear. One of the most enduring works of the time, Woodson’s *Mis-Education of the Negro* specifically details the consequence of removing African heritage from the consciousness of the “negro.”

Likewise, as African countries emerged from European colonialism, African leaders and scholars sought to reconnect to cultural heritage that predated the colonialism. Kwame Nkrumah (1961), Jomo Kenyatta (1962), and Julius Nyerere (1967) were among the first to articulate how to authenticate the African self through educational institutions rooted in the cultural heritage of their respective people and the way citizens find meaning for their lives.

The current surge in the establishing of formal African-centered rites of passage programs is an extension of the cultural nationalist, Black power, and alternative education movements of the 1960s and 1970s and the organizing of African principles into scholarly discipline in the 1980s. This popularized an African worldview and the need to socialize African American youth to it.

Orita for Black Youth: An Initiation Into Christian Adulthood (1977) and *Bringing the Black Boy to Manhood* (1985) were among the first publications to explicitly discuss a rites of passage process for African American youth. By the 1990s, a number of articles and books had been written about rites of passage for African American youth. The most prolific author was Nsenga Warfield-Coppock, who has published curricula, books, and scholarly articles. However, it was *African-Centered Rites of Passage and Education* in 1996 that explicitly made the connection between the tenets of the rites of passage process, pedagogy, and educational assessment, particularly as they pertain to the academic success and performance of African American students. Since then, there has been a growing interest and study of African-centered rites of passage and their implications for delivering and assessing education for African American students.

ROBERTS V. CITY OF BOSTON

Roberts v. City of Boston (1849) was an early challenge to school segregation in Boston, Massachusetts, where a large abolitionist community had experienced some success in seeking equal rights for African Americans. The court found that the school committee had the right to keep separate primary schools for African Americans and Whites, even though doing so was a repugnant distinction of class. Like the later ruling in *Plessy v. Ferguson*, this decision supported “separate-but-equal” policy.

Historical Context

In the early to mid-1800s, legal enslavement dominated the southern states, and overt segregation

was a way of life in most parts of the United States. In many states in the North, however, enslavement was not permitted, but segregation based on race and class was common practice. Massachusetts was a northern state in which enslavement was forbidden by the state constitution but racial discrimination was fully accepted. African Americans and Whites fought together against racial inequality and injustice in the state.

In 1833, the Massachusetts General Colored Association, an African American organization, joined the New England Anti-Slavery Society, a White abolitionist group, to oppose enslavement and racial discrimination in Boston and throughout the North. The revolutionary New England Anti-Slavery Society challenged the Massachusetts legislature to repeal several discriminatory statutes. By 1844, the New England Anti-Slavery Society had successfully convinced the state legislature to repeal statutes prohibiting interracial marriage and the Massachusetts railroad companies to end segregated rail cars. The legislature and the courts did not deem racial discrimination illegal, Massachusetts statutes did not set forth any distinctions based on race, which was a major victory. Nevertheless, the Boston Board of Education's school committees upheld the nearly century-old practice of maintaining separate schools for African American and White children as seen in the *Roberts v. City of Boston* case.

Facts of the Case

In 1849, Benjamin Roberts, an African American man, sued the Boston School District on behalf of his 5-year-old daughter, Sarah C. Roberts, who was denied access to the primary school because of her race. Roberts claimed that his daughter was unlawfully excluded from the primary school that was closest to their home. Furthermore, he cited the Massachusetts Constitution and laws, which emphasized that all persons, without distinction of age or sex, birth or color, origin or condition, are equal before the law.

The school district argued that the Roberts girl had access to a school, set apart for African American children, which was a part of the school committee's regulation to keep White and African American children separate. The school committee believed it was legal, just, and in the best interests

of African American children to have a separate educational facility from White children. Therefore, the Massachusetts Supreme Court had to ascertain the rights of individuals with regard to schools and whether the school regulations of providing separate schools violated African American children's rights under the state laws and the constitution.

The Massachusetts Supreme Court held that Robert's lawsuit could not stand because the school committee had the power to regulate the school system in the absence of special legislation. The court concluded that the school committee used its experience and judgment when it determined that it was best to maintain separate primary schools for African American and White children. The Massachusetts court further noted that maintaining separate schools perpetuated the loathsome distinction of class, but these prejudices were not created by law and probably could not be changed by law.

Although the *Roberts* case took place in a state that did not practice enslavement, the Massachusetts courts and its society considered race and class to be one in the same. African American children were of a lower social class, and those individuals in the White race were of a higher class. Given their lower status, African American children were not to attend the same schools as White children. Despite African American Bostonians and the New England Anti-Slavery Society's dramatic efforts and numerous petitions to Boston's school committees to desegregate schools, the school committees refused to acquiesce. The Massachusetts courts deferred to the wisdom of the school committees, particularly in the *Roberts* case; thus, the courts upheld that practice of "separate but equal."

Impact of the Ruling

In 1855, the state of Massachusetts made great strides to end racial segregation in public schools. Specifically, the legislature enacted a school desegregation law that specifically forbade public school districts from considering race or color as qualifications for school admissions. Throughout the 1850s and 1860s, abolitionists and elite, well-educated African American Bostonians continued to fight for total desegregation and equality in White mainstream society, especially after the Fugitive Slave Act and the *Dred Scott* case of the

1850s. While they made progress in the state of Massachusetts, namely in education, segregation and discrimination increasingly became a national problem. Efforts were stalled by a landmark U.S. Supreme Court case.

In the infamous 1896 case of *Plessy v. Ferguson*, the U.S. Supreme Court had an opportunity to deem the practice of race separation an illegal act, especially in light of the recent enactment of the Fourteenth Amendment of the U.S. Constitution. The Fourteenth Amendment specifically included the equal protection clause to bring about equality for formerly enslaved Africans. The Supreme Court, however, chose to make the doctrine of separate but equal the law of the land for the next 55 years. Accordingly, the long-standing practice of race separation was immortalized in 1896 with legal authority behind it.

After the *Roberts* and *Plessy* cases, several education cases followed where the separate-but-equal doctrine took precedence over the equal protection clause of the Fourteenth Amendment. For instance, in the 1899 case of *Cumming v. Richmond County Board of Education*, African American parents complained that using their tax dollars to maintain a public high school for the sole purpose of educating White children without a similar school for African American children violated the Fourteenth Amendment of the U.S. Constitution. The U.S. Supreme Court held that the Georgia Board of Education did not violate the Fourteenth Amendment by not permitting the African American and White children to attend school together, even though 60 African American high school students did not have a school of their own to attend, because race separation had to be enforced in schools. The Court decided that the White children should not be denied educational privileges just because the board of education could not afford to maintain a separate school for African American children. Simply put, segregation in education was a bastion of U.S. society; Massachusetts was an anomaly.

ROSENWALD FUND

The Rosenwald Fund, established in 1917 by philanthropist Julius Rosenwald, became a major agency pivotal to the provision of African American education in the South during the early 20th century. Unlike other industrial philanthropists, Rosenwald and his fund earmarked funding for a particular campaign: the erection of school buildings and structures. By the program's end, the Rosenwald Fund participated in the creation of more than 5,000 schools across 15 states. The Rosenwald Fund's school-building program ended in the early 1930s, and Rosenwald died in 1932. Although its curriculum narrowed the type of schooling African Americans received, the Rosenwald Fund left a positive legacy in that the schools it created helped make the concept of universal schooling a reality for African Americans in the South. This entry looks at the fund and its contributions.

Historical Context

Julius Rosenwald, a White Chicago businessman made wealthy by his involvement with Sears, Roebuck and Company, began his career in philanthropy in 1910. Influenced by liberal Judaism and the ameliorative spirit of the Progressive Era, he donated funds to African American and White organizations that served poor and immigrant populations in Chicago.

Rosenwald preached personal initiative and social responsibility and often paired his donations with the demand that the communities and organizations to which he contributed raise matching funds. Gradually, his attention turned from the

North to the South, but the notion of challenge grants remained. Beyond his southern focus, he began to concentrate nearly all of his philanthropic attention on African American schooling.

At the time, very few African American primary and secondary schools existed in the South, and many of those that did were in horrid condition for lack of local tax support. Rosenwald sought to remedy the situation by promising financial donations if African American communities contributed matching funds. Rosenwald also attempted to influence the curriculum at the schools by supporting the construction of certain types of school buildings.

His close relationship with Booker T. Washington, principal of the Tuskegee Institute, influenced his opinions on the proper curriculum for African Americans as well as their proper place in the social, economic, and political order. In particular, Washington supported the notion that African American education should focus on economic advancement through vocational education without challenging segregation and African American political disfranchisement, a controversial stance at the time.

Washington's belief in self-help and social stability closely mirrored Rosenwald's own ideas on community uplift, and Rosenwald's first foray into the building of schools was the construction of six schools in rural Alabama overseen by Tuskegee and built in 1913 and 1914. The small-scale project foreshadowed the role the Rosenwald Fund took after its creation in 1917.

Programs of the Rosenwald Fund

The curriculum at Rosenwald schools, which was supported by the school structure, focused primarily on industrial training and manual labor training at the expense of the liberal arts curriculum. The fund accomplished its task by surveying the area in which a school was to be built for occupations open to African Americans and then translated that reality into school structures that included spaces for the appropriate training.

The school building campaign touched both primary and secondary schools. With regard to the primary schools (also called common schools), the Rosenwald Fund accelerated the growth and proliferation of schools in rural areas. By 1928,

one of every five African American rural schools was a Rosenwald school, and those schools housed one third of the South's rural African American students and teachers. The curriculum included rudimentary literacy skills.

By the late 1920s, the fund was playing a vanguard role in the creation of high schools in which agricultural and manual training for boys and home economics for girls dominated the school day. The fund also financially supported the creation of industrial shops and teacher's homes to facilitate the educative enterprise.

As required by the Rosenwald Fund, African Americans matched the grants for primary and secondary schools with their own monetary gifts as well as free labor, materials, and land. Though Rosenwald Fund contributions were pivotal, African Americans donated the most resources to the school-building campaign. James D. Anderson found that the Rosenwald Fund contributed \$4,364,869 over the course of its history, while African Americans donated \$4,725,891 during the same period.

African Americans did not wholeheartedly accept the fund's ideological bent regarding racial relationships and the curriculum. Some communities, in dire need, allowed the fund to create schools with a Tuskegee-style education, while others demanded schools that at least merged vocational education and the liberal arts.

The Rosenwald Fund also supported certain Black colleges. Believing that African Americans should be educated to assume positions in a parallel society that did not challenge the existing racial hierarchy, institutions with a similar ethos—like Tuskegee—received large donations. In fact, Rosenwald himself had joined the Tuskegee Board of Trustees in 1912.

The fund and other industrial philanthropic organizations dangled the carrot of monetary contributions to liberal arts colleges to alter their curriculum to fit a conservative notion of the proper end to which African Americans should be educated. Fisk University initially accepted their generous donations and altered the curriculum, initiated segregated on-campus entertainment (which had never occurred previously), and promised to educate students to adapt to the existing racial hierarchy.

Fisk students and alumni, including W. E. B. Du Bois, were infuriated and initiated letter-writing

campaigns and demonstrations. College officials eventually relented. Their actions presaged the end of vocational education writ large. The mission to direct the path of African American education through physical space became outmoded during the 1920s in the aftermath of World War I and the emerging spirit of the New Negro.

RURAL EDUCATION

Rural communities share a uniqueness that most urban and suburban communities do not. Rural communities have social relationships that are personal and close; people are known as individuals, values are traditional, and the family structure is more intact. Consequently, inhabitants of rural communities share close personal and professional networks, and such close ties extend to the school community.

In most small, rural communities, the school is the common core of the community. Not only does the school provide an education for the children, but it also serves as a community center where residents come together for various social events. Because the school plays a number of roles in rural communities, rural residents fight school consolidation efforts. Proponents of smaller schools in rural districts argue that small schools have lower rates of crime and violence and greater rates of parental involvement and community support. Additionally, research by Rural Policy Matters in

2006 states that where schools are small, there are more citizens who directly take part in and responsibility for the process of schooling in their community through participation in things like parent-teacher groups, community fund-raising efforts, boosters clubs, and school activities and events. However, Lareau's 2000 study found that parents in rural areas tend to be less involved in their children's lives and are more intimidating in their child-rearing tactics. Although the research is mixed on parental support in rural schools, it seems that rural communities provide an educational basis for its residents that extend beyond the academic curriculum.

Research suggests that rural education tends to benefit students from a school-community relations perspective; however, many rural districts face many challenges in the education of their students. Rural schools and districts are confronted with unique challenges stemming from loss of population, declining enrollments, and lack of resources. However, researchers and policymakers often focus their attention on urban education due to the large numbers of students that are served by urban districts. According to a report published by the Rural School and Community Trust in 2007, nearly 10 million students attend school in rural districts, and 29% of public school students attend school in communities with fewer than 25,000 people. With approximately one third of the nation's pupils receiving education in rural districts, there is a pressing need for researchers and policymakers to understand the context of rural education.

Rural educators and students struggle to thrive academically in environments plagued by scarcity of financial and human resources, fewer highly qualified teachers, low graduation rates, and geographic isolation. An understanding of community context is important when comprehending how rural schools function and in determining the causes of educational failure. Rural education also suffers from the lack of political capital. Often, researchers and policymakers who have an interest in rural education are overshadowed by the demands of urban education. Given the societal constraints that affect rural education, this entry highlights rural education from the following perspectives: school finance, recruiting and retaining teachers, and technological advances.

School Finance and Rural Education

Debates and court cases abound concerning the funding inequities that exist among urban, suburban, and rural schools. Because schools are primarily funded by local property taxes, school districts with more expensive residential and commercial property have substantially greater resources available to support education. Thus, small rural districts have fewer economic resources, and this disparity trickles down to the classroom level. There are three levels of funding provided by the government—local, state, and federal—that add to educational spending. If rural schools are to give the same services to their students as larger schools, the cost of program per person should be higher, but these schools do not receive extra money.

In rural areas, fiscal management is often provided at very small units of administration, because both schools and districts are small. Thus, fiscal personnel in such districts are rarely specialized and frequently have inadequate training for the work. Thus, rural districts face challenges in determining the equitable distribution of their financial resources. Several southern states, including North Carolina and Georgia, have faced challenging lawsuits involving the discrepancies in financial resources dispersed among rural, suburban, and urban school districts.

School Funding

A North Carolina case, *Leandro v. State of North Carolina*, is a 1997 decision that is ongoing at the North Carolina Superior Court. Plaintiffs in the case alleged the following: (a) Children in their poor school districts are not receiving a sufficient education to meet the minimal standard for a constitutionally adequate education, and (b) children in their districts are denied an equal education because there is a great disparity between the educational opportunities available to children in their districts and those offered in more wealthy districts of our state. Plaintiffs allege that their districts lack the necessary resources to provide fundamental educational opportunities for their children due to the nature of the state's system of financing education and the burden it places on local governments. They further allege that although their poor districts are the beneficiaries

of higher local tax rates than many wealthy school districts, those higher rates cannot make up for their lack of resources or for the disparities between systems.

Teacher Salaries

According to Reeves, teachers in rural districts make only 88% of the salaries of their nonrural peers, and the disparities that exist among teacher salaries are due in large part to state funding formulas. In *Tennessee Small School Systems v. McWherter* (1993), the Tennessee Supreme Court held that the Tennessee General Assembly must maintain and support a system of free public schools that affords equal educational opportunities to students in small counties as well as large, and rural counties as well as urban.

Teacher pay in rural districts, such as those in Tennessee, also plays a role in recruiting and retaining highly qualified teachers. Reeves notes that attracting teachers to smaller rural districts might require higher salaries. School districts that do not have the resources to attract teachers find themselves at a loss in recruiting and retaining highly qualified teachers. Gibbs also found that urban salaries are approximately 21% higher for starting teachers and 35% higher for teachers with master's degrees and 20 or more years of experience. Although various reasons explain the gap between the salaries of rural and urban teachers, the lower prevailing wages in rural school districts may mean that these districts make do with less-qualified pools of candidates and face retention problems.

Recruiting and Retaining Teachers in Rural Districts

Recruiting and retaining quality teachers remains a major concern for rural school districts. Many teachers do not want to stay in rural areas because of isolation, whether it is social, professional, or cultural. In addition, teachers in rural areas face many challenges, such as low salaries, lack of access to professional opportunities, and the responsibility of taking on multiple duties. The greatest pool of teacher applicants for rural districts is students who were educated in the district and feel a compelling need to return home. It has

been suggested that the “ideal” rural teachers balance multiple duties: teach multiple grades or subjects, organize extracurricular activities, and adjust well to the environment and the community. Combined, these needs make it difficult to recruit qualified teachers to rural districts.

Not only is it hard for rural districts to recruit highly qualified teachers, but it is difficult to retain the teachers that they do attract. A major reason for high teacher turnover in rural schools is the lack of suitable living quarters. Teachers who must drive long distances to work because of a lack of housing are more likely to leave their positions than teachers who live in or near the community where their schools are located, according to Lowe.

As noted earlier, low salaries also deter highly qualified teachers from teaching in rural areas. Rural districts must develop creative strategies to retain highly qualified and highly effective teachers. Lowe suggests that rural districts should consider offering teacher incentives such as bonuses. Such incentives should be available to veteran teachers as well as novice teachers. Additionally, some rural districts offer teachers loans whereby school districts assume full or partial responsibility for payment of student loans and other less expensive debts for beginning teachers. Although some rural districts may find it financially difficult to fund such incentives, the long-term result may be worth the short-term debt.

Rural Education and the Achievement Gap

Rural district leaders understand that they lead hard-to-staff schools. Additionally, they also understand that they are not exempt from meeting the demands of the federal No Child Left Behind Act (2001) and closing the academic achievement gap. The achievement gap exists among all students, and it exists among lower- and higher-socioeconomic status students. Consequently, due to the large numbers of underrepresented students and students raised in poverty, rural education is often hit hard in the achievement gap. People who live in rural communities in the U.S. are generally poorer than their urban and suburban counterparts, and Williams showed that rural poverty rates are highest in areas with large concentrations of people from underrepresented groups. Despite

the high poverty rates, Lee found that students in rural areas tend to score as well as or better than their urban peers on standardized tests. Smaller class size often outweighs the poverty effects of students who attend schools in rural districts. Howley, Strange, and Bickel note that small schools tend to have lower student–teacher ratios, higher graduation rates, and lower rates of absenteeism. Combined, these factors compensate for the poverty factors that often plague rural school districts. Additionally, positive school–community relations accounts for students’ success in rural districts.

Stepping into the 21st Century: Technology and Rural Education

Since rural districts face difficulty recruiting and retaining highly qualified and highly effective teachers, distance education fills the gap in hard-to-staff math and science courses. In order for rural students to compete for college admissions, they must take higher-level math and science courses. Often, individuals who are qualified to teach such courses do not reside in rural areas, nor do they teach in rural systems. More important, they often do not choose teaching as a career.

Given these conditions, students in rural districts often take trigonometry or chemistry via satellite. Although this method of instruction may not be the best, it does offer courses that would otherwise not be taught in rural districts. In an effort to support rural education, the National Science Foundation and the U.S. Department of Education determined more than a decade ago that technology would be the link to providing adequate education in rural communities. Combined, they argued that the appropriate use of technology would improve teaching and instruction, expand and enrich learning opportunities, support systemic change, and provide equal access to learning opportunities.

Twenty-first century advancements in the capabilities of high-speed Internet and advanced telecommunications systems give rural regions their first real potential to overcome geographic isolation. Due to the vast growth in technology and telecommunications systems, geographically isolated rural districts are able to receive an education that

is no longer inferior to their urban and suburban counterparts.

Shedding Light on Rural Education: What Next?

Historically, the term *rural* denotes White farmers, poverty, and ignorance as a way of life. Still today, the negative connotation associated with *rural* overshadows the significance and relevance of rural education. According to the National Center for Education Statistics, the definition of rural schools was revised in 2006 after working with the Census Bureau to create a new locale classification system to capitalize on improved geocoding technology and the 2000 Office of Management and Budget definitions of metro areas that rely less on population size and county boundaries than proximity of an address to an urbanized area.

Regardless of the change in definition of the term *rural*, rural areas continue to be plagued by stagnation in employment and industry. Many students who leave rural communities for higher-education purposes never return. This continued cycle of stagnation leads to a decline in the overall population of rural areas, and it leads to a decrease in the educational attainment of inhabitants in rural communities.

Although today's rural students leave and return at a lesser rate, they leave with a unique characteristic. Often, they have been educated in underfunded schools with less than highly qualified teachers; however, rural students tend to succeed because they have rural qualities, such as strong community ties, that help propel them in their careers. Given the positive social relations formed in rural communities, students educated in rural communities tend to succeed against the odds.

SABBATH SCHOOLS

Sabbath schools sprung up throughout the South during and after the Civil War; they were established and almost exclusively maintained by formerly enslaved African Americans. These church-sponsored schools operated mainly in the evenings and on weekends, and they provided basic literacy and religious instruction to thousands of students who were not able to attend weekday schools. The Sabbath schools, numbering more than 1,000, represented yet another remarkable example of formerly enslaved African Americans seeking, establishing, and supporting their own advancement when freedom universally came in 1865. This entry looks at their history and contributions.

Historical Context

Prior to the Civil War, and throughout much of the South, it was against the law for enslaved African Americans to become literate, freely attend their own places of worship, or legally marry. It was feared that a literate enslaved African or an enslaved African with too much autonomy would be dangerous and discontent; therefore, laws were created to discourage teaching enslaved men and women even the alphabet or allowing them to attend church or marry.

When universal freedom came in 1865 with the adoption of the Thirteenth Amendment to the U.S. Constitution, which abolished enslavement, the denial of literacy, and the most basic human dignities, it

evoked in formerly enslaved African Americans the will to obtain all things deprived to them during enslavement. One way to combine their desire to become educated and attend a place of worship at the same time was to establish a school that did both.

Sabbath schools, about which very little is known, operated largely on the strength of the formerly enslaved community. Frequently, Sabbath schools were established before free or public schools, and they were part of a larger network of grassroots schools that aided and educated freedpeople. Between 1863 and 1870, they existed alongside (a) the day school, which educated primarily freed children; (b) the night school, which educated laboring freed adults; (c) the regimental schools, which educated African American men enlisted in the Union Army; and (d) the hundreds of self-supporting schools started by free and freed African Americans throughout the South. Combined, these grassroots schools educated more than 900,000 freed African Americans during these years.

Consequently, Sabbath schools served as an additional place of instruction for freedpeople. They offered not only a place of learning but also a place of worship, and they became an easy way for teachers to coordinate and offer instruction to a mass number of people at one time. Every Sunday, hundreds of freedpeople attended a Sabbath school at which students sang, learned to read, and participated in patriotic lessons alongside religious instruction. Freedpeople learning the rudiments of literacy in a day, night, regimental, or self-supporting school started by free or freed African Americans could expand and demonstrate

their newfound skills by reading and reciting the Bible during Sabbath processions. Reading, explaining, and understanding scripture in Sabbath school allowed freedpeople to coalesce two of their most personal ambitions: becoming literate and being versed in the Bible.

Contributions

Sabbath schools were truly a testament to the self-determination and value African Americans—free or freed—placed on literacy. Despite their limited recognition in U.S. educational history, they were startlingly successful. They might have been relegated to further obscurity if it were not for the detailed records of the Bureau of Refugees, Freedmen, and Abandoned Lands, better known as the Freedmen's Bureau. Between 1865 and 1870, the Freedmen's Bureau was the only organization laboring in the South to chronicle the activities and progression of Sabbath schools. John Alvord, general superintendent of schools for the Freedmen's Bureau, deduced that the Sabbath school played as significant a role in the education of formerly enslaved African Americans as any other school established for freedpeople in this period.

Perhaps more than any other school of the time, Sabbath schools educated a generation of freedmen and women in literacy, the ways of civic responsibility, and religion, as well as systematically assisted in the reducing illiteracy among adult freedpeople. It is estimated that, in 1866, 1,512 Sabbath schools with 6,146 teachers and 107,109 pupils existed throughout the South. Sabbath schools continued to grow in the African American community, and by 1868, the African Methodist Episcopal Church enrolled an additional 40,000 pupils in its own Sabbath schools. By 1885, the church reported nearly 200,000 children enrolled.

The role Sabbath schools played in the educational and religious advancement of a people just removed from enslavement cannot be overestimated and should be placed within its proper historical context. In contemporary times, it reminds the public of the agency of a people landless, illiterate, penniless, and just removed from enslavement and having the resolve to effect change for themselves. U.S. popular consensus portrays African Americans during this epoch of U.S. history as helpless, formerly enslaved Africans and displaced

people, rather than as a people who emerged from enslavement—despite its disadvantages and vices—with strong values, a sincere belief that literacy and knowledge were pathways to freedom; vision, leaders, and an ability to establish institutions critical to their own advancement.

Freed African Americans wanted schools, churches, the vote, legal marriages, judicial equality, land, and a host of other considerations that would define them and their children as free. When the opportunity arose, they did everything within their power to acquire these historically denied rights and opportunities.

SANKOFA SHULE (LANSING, MICHIGAN)

Despite its modest beginnings, Sankofa Shule at its zenith was touted as “one of the educational powerhouses of charter schools” by *U.S. News & World Report* in its April 27, 1998, issue. Sankofa Shule began in Lansing, Michigan, as a charter school that served students from preschool through third grade; it continued to add a grade each year for the next 5 years to retain its students through middle school. Under the leadership of Dr. Freya Rivers, Sankofa Shule was able to transform the educational experience for African American children in the Lansing, Michigan, area, and because of its success, Sankofa

Shule became a model for other African-centered and charter schools. This entry describes the philosophy, teachings, and operating principles of Sankofa Shule.

Principles and Curriculum

As an African-centered school, Sankofa Shule used several guiding principles, ideas, and ideologies that were based in African thought and practice. The ancient Kemetic (Egyptian) principles of Maat and the teachings of Ptah Hotep served as guidelines for righteous behavior. The principles of the Nguzo Saba from Dr. Maulana Karenga's Kawaiida Theory served as daily living guidelines for students, their families, and the Sankofa Shule village. The African proverb, "It takes a village to raise a child," served as the platform on which the faculty and staff stood.

Although a charter school, Sankofa was largely guided by the Council of Independent Black Institution's (CIBI) protocol for African-centered education: the acknowledgment of African spirituality, the act of redefining people of African descent, the emphasis on nation building through reliance on the strength of the family, the preservation of relevant customs, the insistence of viewing all things from an African worldview, and the idea that none of this can be accomplished if those who are teaching have not yet reached self-actualization (CIBI Web site).

Sankofa's philosophy of African-centered education began with the belief in the child, the genius that lies within each child, and the perfectly balanced, holistic education needed to educate that genius. Students' physical, emotional, social, academic, and spiritual well-being was key when considering curriculum, student placement, and discipline. Parents' roles, indicating the strength of the family, were also crucial for the students' and the shule's success. Therefore, the curriculum included the usual fare—language arts, science, mathematics, history, Spanish, French—and the not so usual—Swahili, Japanese, sign language, martial arts, African dance, African drumming, and drill team.

Policy and Practice

Students were not placed in classrooms based on traditional grade levels. Instead, the four Dogon

principles that indicated levels of cognitive ability: *Giri so* (front speech; knowledge of the world only through literal and concrete examples), *Benne so* (side speech; building on the knowledge developed in *Giri so*, but moving toward multiple interpretations of things in the world), *Bolo so* (the "back" speech; moving from the literal to the abstract by learning how to synthesize information), and *So dayi* (the clear word or understanding; understanding and relating to the world beyond synthesizing information, rather manipulating, interpreting and reacting to its abstract qualities based on one's personal transformation)—were used as the measuring stick by which students were assessed and grouped.

Discipline for various infractions was determined only after considering the child's physical, emotional, and spiritual health. Different challenges required different remedies or solutions. Students who did not complete their homework or who did not perform well on an assessment did not have the same consequences as those who had had behavioral challenges in the classroom. And, in the rare instances when there were behavioral problems that required more substantive deeper interventions, both students and parents found that the shule's position on suspensions—"not the student from school, but the parent from work"—required the strength of the village to keep the child in a nurturing, educational environment instead of excusing the child from his or her responsibilities by way of suspension.

In addition to their support of the discipline policies, parents' supported the shule by adhering to and supporting the shule's other policies (for example, uniform, attendance, homework, field trips) by volunteering within the school and by attending school functions. They also had a strong presence on the board. At its inception, Sankofa Shule was managed by a board comprised of dedicated parents, community and educational leaders, and teacher and staff representatives. The original board of Sankofa Shule worked tirelessly. Although not an obligatory part of their duties, board members recruited new students, provided supplies for the shule, sewed uniforms, served lunch in the building, and truly supported the work of the faculty and staff. Board members supported the founder's ideas about "schools without walls" by launching vigorous fund-raising campaigns, many times committing

their personal resources, to support the shule's field trip fund. Because of these efforts, in addition to the in-state field trips the students took every year, students at Sankofa Shule also had opportunities to visit major cities and states across the United States (for example, Washington, D.C.; Los Angeles; Chicago) and Egypt.

Finally, the success of the shule was rounded out by its leader, Dr. Freya Rivers, who led by example, and a dedicated staff. Dr. Rivers, whose responsibilities included being the administrator and a teacher in the shule, required that her teachers employ a 10-step plan (*From Heshima to Hotep*) for educating the African American child and achieving peace in the classroom. Using these 10 steps as the foundation for creating master teachers, Rivers ensured that all teachers were teaching from the same base and that no child or teacher would be "left behind." Rivers did not believe that teachers had to be certified through a traditional teacher education program. Indeed, she believed that, in order to teach African American children in an African-centered environment, it might have been better if the teachers had not come to teaching by the traditional route. To help her teachers reach self-actualization, Rivers required the teachers to attend *Indaba* (Swahili for "serious discussion") every morning. These meetings included (a) discussions around a reading selection from both a cultural and educational text; (b) conversations about the students, which focused not only on academics but on the children's overall well-being, including family issues; and (c) teaching strategies and suggestions, based on classroom observations, to reach every child in the classroom.

SCHOMBURG CENTER FOR RESEARCH IN BLACK CULTURE

Arturo Alfonso Schomburg, Afro–Puerto Rican historian, scholar, and bibliophile, known especially for his impressive and extensive collection of books, periodicals, and artifacts pertaining to people of African descent in the United States, Latin America, and Spain, lends his name to the Schomburg Center for Research in Black Culture. Starting as a branch of the New York City Public Library, the center became and remains what its namesake desired: a research center as well as a civic and cultural agency for the community. This entry tells the story of Schomburg and the center that bears his name.

Biographical Background

Schomburg was born in 1874, in St. Thomas, U.S. Virgin Islands, but was raised in Puerto Rico by his mother's family. Little is known of his life prior to his emigration to New York in 1891. There he began to immerse himself in African American culture, including freemasonry, community activism, and research. Dedicating his efforts at collecting materials of affirmation to the history, contributions, and identity of people of African descent, he became widely known and respected as a keeper of African American history and for his ability to find rare and lost items.

He was motivated by what he called "our false history" and argued, "History must restore what slavery took away, for it is the social damage of slavery that the present generation must repair and offset." As one of the founders of the Negro Society for Historical Research and president of the American Negro Academy, he sought to coordinate bibliographic information to be used by libraries, scholars, and collectors nationally, and dreamed of a single repository to ease the burden of researching and allow the process to move more quickly than his own experience had been. Although not formally educated, he was nevertheless viewed as an authority worldwide on issues pertaining to people of African descent.

In 1925, the New York Public Library established a Division of Negro Literature, History and Prints at the 135th Street Branch. With every free

space of his home overflowing with books, prints, and other memorabilia, Schomburg was persuaded in 1926 to sell his private collection to the Carnegie Corporation and to deposit it at the branch. His collection is estimated to have contained more than 10,000 pieces. Schomburg served as curator for the library from 1932 until his death in 1938, and soon afterward, the branch was renamed the Schomburg Collection.

In 1972, it was named a national resource by the National Endowment for the Humanities, attracting professional librarians nationally. Soon after, it was transferred to the Research Library Division of the New York Public Libraries system, moved to a larger facility, and renamed again as the Schomburg Center for Research in Black Culture.

Resources and Achievements

Today, the Schomburg Center is recognized as a premier national research library and educational center devoted to collecting, preserving, and providing access to resources documenting the experiences of peoples of African descent throughout the world. The center's collection contains more than 5,000,000 items, including art objects, audio and video tapes, books, manuscripts, motion picture films, newspapers, periodicals, photographs, prints, recorded music discs and sheet music; it also provides services and programs for constituents from the United States and abroad. Library materials at the Schomburg Center are housed in five collection divisions: art and artifacts; general research and reference; manuscripts, archives, and rare books; moving image and recorded sound; and photographs and prints.

The Art and Artifacts Division contains more than 20,000 items from African and the African Diaspora, including sculpture, paintings, works on paper and textiles, and material culture. The center's collection is especially strong in art produced during the New Negro Movement, Harlem Renaissance, and Works Progress Administration, with murals by Aaron Douglas, Jacob Lawrence, and Romare Bearden; 19th-century artists such as Henry Ossawa Tanner are also represented. Rare items from Ghana, African weaponry and bronze adornment from Nigeria, Mali, Morocco, and Ivory Coast, and anti-apartheid posters are also included in the collection.

The Jean Blackwell Hutson General Research and Reference Division, the largest section of the center, contains more than 150,000 volumes, 85,000 microforms, more than 6,000 serials that include 400 African American newspapers and 1,000 worldwide periodicals, mostly focused in humanities and social sciences, and including some resources that cover medicine and the natural sciences. Items in this collection are primarily in English but also include works in a variety of African and European languages. The center's search engine, the Ernest D. Kaiser Index to Black Resources, provides nearly 200,000 citations to articles in thousands of issues of African American magazines and newspapers.

The Manuscripts, Archives, and Rare Books Division allows scholars and researchers to work directly with original source materials and contains more than 3,900 rare books, 580 manuscript collections, and 15,000 pieces of sheet music—including European classical music by composers of African descent—and rare printed materials, dating from the late 16th through the 20th centuries; these include the original manuscript of Richard Wright's *Native Son* and records of the Civil Rights Congress.

Offering more than 5,000 hours of oral history recordings and more than 5,000 motion pictures and videotapes of early African American film classics, documentaries, and radio programs, the Moving Image and Recorded Sound Division is unique indeed. The collection is complemented by a current special Oral History/Video Documentation Project that videotapes interviews with historically or culturally significant figures.

Photographers represented in the Photographs and Prints Division include James VanDerZee, Gordon Parks, Carl Van Vechten, and Bert Andrews. The more than 500,000-item collection boasts images from mid-18th-century graphics and portraits of several prominent 19th- and 20th-century African American artists, political figures, and social activists. It is especially strong in images of enslavement, the Civil War, Harlem, and the civil rights movements.

In keeping with Arturo Schomburg's vision, the center's Educational and Cultural Programs complement the research work and collection; seminars, workshops, film screenings, and the like are presented year-round in the renowned Langston Hughes Auditorium. The center also presents yearly

exhibitions from its own holdings and other institutions. The Traveling Exhibitions Program features exhibits on various themes, including the African American press, migration, and anti-apartheid struggle. Also offered are Summer Institutes for teachers and curriculum guides. In 1986, a Scholars-in-Residence Program was established; this provides long-term fellowship support for research projects that draw heavily on the center's collections and resources.

SCHOOL CHOICE

This entry begins with a description of the various forms of school choice, including charter schools, magnet schools, alternative schools, small schools, vouchers (publicly and privately funded), tuition tax credits, and homeschooling. Each of these school choice forms has distinct political origins and different assumptive foundations in terms of policy goals. Still, with all of their popularity, school choice reforms are undeniably controversial. The entry also discusses the charged issues related to school choice, including race and equity, accountability, finance, and governance. Many school choice forms are contested because they fundamentally alter the traditional mechanisms and structures that govern schools and school systems. The most controversial school choice forms

tend to emphasize market-driven approaches. Specifically, school choice forms that rely heavily on the deregulation of equity provisions, the dismantling of teachers unions, competition, and the private sector often draw the most ire.

School choice is one of the most popular educational reforms in the United States. In recent years, it finds increasing favor among African American parents and community advocates who have been frustrated by how their children fare in traditional public schools. Yet school choice is also a politically charged educational issue, one that intersects with racial inequality and the role of public education in a democracy.

Some of the most vocal critics of some forms of school choice are traditional civil rights organizations such as the National Association for the Advancement of Colored People (NAACP), national teachers unions, and public school advocacy groups. Their historical opposition to choice stems, in part, from one southern response to court-ordered school desegregation, that was that local school district officials would establish state-funded, private school choice plans—what some have termed “segregation academies”—that excluded participation by African American students.

Yet, because school choice encompasses a wide set of policy initiatives, and because it also has progressive roots in the community control and alternative schools movements, it is exceedingly popular with policymakers of all persuasions, community advocates, parents, teachers, and school leaders, and members of the private sector. Moreover, “new” civil rights organizations have emerged, such as the Black Alliance of Educational Options (BAEO) and the Hispanic Council for Reform and Educational Options (HCREO), whose primary focus is to advance school choice for Black and Latino communities.

The support for choice from these disparate groups stems from different ideological, philosophical, and pedagogical orientations. Community advocates, parents, teachers, and school leaders who support choice tend to favor the policies because of their potential to empower those who lack power under bureaucratic school governance structures. They also believe that school choice can facilitate the development of more rigorous, responsive, and innovative schools. Many policymakers and business leaders support school choice because they adhere to

the tenets of the market metaphor for school improvement, namely, the theory that competition for students will cause schools to ratchet up their teaching lest they go out of business for lack of “customers.” Central to this theory is the assumption that parents will choose schools that have strong academic programs and student outcomes.

Traditional public school advocates—teachers unions, parent-teacher associations, and civil rights groups—have been opponents and/or tepid supporters of some forms of school choice, primarily because they reject the market metaphor for schooling, based upon a multipronged argument: (a) The most likely choosers will be the most advantaged, leaving the least advantaged—poor students of all racial backgrounds and African American students—segregated in underresourced schools; (b) parents choose schools for a number of reasons besides achievement data, such as the racial demographics of the school, their perceptions of the school’s safety, and the school’s proximity to work or home; (c) some forms of choice undermine teachers unions; (d) school choice reforms cause traditional public schools to lose needed funding and political support; and (e) the notion that schools should compete for students the way businesses compete for customers misunderstands and corrupts the democratic purposes of public education. The contested nature of school choice reforms has resulted in a myriad of policies that reflect the multiple goals and points of dissension surrounding school choice theory.

Forms of Choice

Charter Schools

Minnesota legislators passed the first charter school law in 1991, quickly followed by California in 1992. The premise upon which charter school reform is based is that bureaucracy has stifled educational innovation and consequently student achievement. Charter school policy provides schools with freedom from many state and local regulations. In exchange for their freedom, schools promise that their students will produce greater achievement on standardized assessments. If schools fail to live up to their achievement goals, they can lose the charter granted to them by their district or chartering authority.

In 2007, there were roughly 4,000 charter schools in operation serving just over 1 million students in 40 states and the District of Columbia. Most charter school policy stems from state legislative action, and each state’s law differs in terms of the degree to that it is permissive or regulatory. The majority of charter school students are in five key states: Arizona, California, Florida, Michigan, and Texas. In general, charter schools appear more often in cities and tend to be small, averaging 200 students a school.

Magnet Schools

Magnet schools accompanied desegregation efforts. As policy instruments, they are meant to retain White and middle-class parents who might otherwise flee schools and school systems that are diversifying by providing a specialized educational focus such as technology, science, or the arts. Most magnet programs have racial balance guidelines and admissions criteria so that schools do not become racially homogenous. Their place in the school choice landscape is that of an institutional hybrid; parents are able to select magnet schools for their children, but schools also choose the students they will admit, based on a number of criteria besides racial-ethnic background: academic achievement, alignment with school focus, and overall educational background.

Vouchers

Vouchers provide subsidy or full tuition children attending private, tuition-based schools of their choice. Voucher programs differ from one another in structure, regulation, and scope. For example, some programs are universal—meaning all school-aged children are eligible, while others are targeted—allowing vouchers to only a specific population, most frequently poor children. Funding mechanisms also differ, since vouchers can be funded publicly or privately. Recently, there have been six publicly financed voucher programs in operation: Colorado; Cleveland; Milwaukee; Washington, D.C.; Florida (this plan is being contested in the courts); and Utah (voters overturned this plan in 2007).

While the state constitutionality of vouchers is continually in question, given that the majority of

private schools are sectarian, the U.S. Supreme Court ruled in 2001 in *Zelman v. Simmons-Harris* that the Cleveland school voucher program did not violate the U.S. Constitution—specifically, the establishment clause of the First Amendment preventing states from establishing an official religion. Still, at the local level, state constitutions often have provisions preventing taxpayer funds to be allocated even inadvertently to religious schools. Voter referenda to enact statewide voucher programs in California and Michigan have also been unsuccessful.

Homeschooling

African Americans comprise one of the fastest-growing groups of homeschoolers. Homeschooling is perhaps the most radical form of choice, since it shuns the state provision of schooling. Parents or tutors teach children, sometimes in cooperatives with other homeschooling parents. Homeschooling can intersect with charter school reform; in California, some of the largest charter schools are homeschooling charters.

Parents who choose to homeschool do so for several reasons. Some adhere to religious beliefs that they feel are undermined by public education, and schooling at home allows them to instill their values into their children. There are liberal and progressive parents who choose to homeschool because they reject the state provision of education and government-sanctioned curriculum. Finally, some parents choose to homeschool their children because they have special educational needs—learning disabled or gifted—that are not being met in traditional public schools.

Tuition Tax Credits

Tuition tax credits vary in program design and by state. In general, these provisions allow corporations and individuals to deduct from their taxes monies spent for donations to or tuition for private schools. Some see tuition tax credits as an end run around the more controversial school voucher concept, while others worry that they are simply vouchers for the middle and wealthy classes whose incomes allow for private school tuition costs. K–12 tax credits exist in Arizona, Illinois, Iowa, Florida, Pennsylvania, and Minnesota, and several other states are considering enacting them.

Alternative and Small Schools

Alternative and small schools tend to be overlooked when observers survey the school choice landscape. There are many types of alternative public schools, and most provide a unique educational environment for students who have struggled in traditional public schools. While the movement to break up comprehensive high schools and replace them with small, specialized academies has been in development since the 1980s, it has recently gained significant momentum due to the significant financial backing of the Bill and Melinda Gates Foundation.

Alternative and small schools share a focus on a particular curriculum or student population, and there are usually application and admission processes. Advocates of these choice reforms argue that alternative and small schools provide better options for students to find their educational niche. Critics worry that the choice process will allow for schools to discriminate in their student selection based on indicators that correlate with race and poverty—such as residence and academic record—and that the schools will increase already existing stratification.

School Choice Politics

Finance and Governance

The ways in which choice schools gain funding and govern themselves has implications for equity and empowerment—two of the central issues driving school choice reforms. Critics worry that school choice reforms will siphon needed resources from traditional public schools. They also worry that parents will lose the opportunity to have a say in the school beyond the choice to enroll their child in it. Research in these areas, as in many aspects of the political aspects of choice, is complicated.

Charter school funding is intertwined with state politics. Many state lawmakers enacted charter school legislation that did not provide schools with start-up funds or monies for rent or capital expenses—key issues in urban areas where starting a school and maintaining a school facility can be financially prohibitive, especially for grassroots groups. Many lawmakers failed to provide adequate funding because they ascribed to the market-informed theory that schools could do more with less. In fact, charter schools increasingly rely on the

private sector for financial and political support. Educational management organizations (EMOs) or charter school management organizations (CMOs) provide school management on a for-profit and/or nonprofit basis. In key states, such as Michigan and Ohio, the majority of charter schools are managed by an EMO or CMO. Thus, the charter school movement has fed the broader movement to privatize public education.

Voucher programs raise similar and distinct issues. Most publicly and privately funded vouchers do not meet the cost of tuition at schools beyond the Catholic school sector. This means parents must supplement the tuition if they enroll their children into more expensive schools. In addition, there is evidence that in Cleveland and Milwaukee, students who were never in public schools have been voucher recipients, thereby increasing the overall state expenditures on education. Privately funded voucher programs require parents to pay partial tuition.

Related to the issue of finance is governance. Charter schools and voucher schools, for example, have boards that oversee the schools' operations and vary in the degree to which parents and teachers are allowed to participate. Whether or not school choice results in greater empowerment as indicated by representation in formal governance, then, is an important issue. Often, school choice rhetoric describes the empowerment aspect as parents being allowed to choose a school, but it says little about parents being able to effect change in a school once they have chosen it. There is great diversity in terms of how parents and community members are able to shape school-level policy in choice schools.

Race and Equity

Also controversial is the relationship between school choice policies and race. The most persistent issue is segregation. Because early school choice plans emerged from segregationists seeking to avoid implementing the desegregation ordered by federal courts, the relationship between school choice and racial exclusion is complex. For some conservative advocates, the hope is that this choice process can disentangle the connection between residence and school assignment, thereby providing more desegregation without the need for state action.

Meanwhile, some progressive advocates believe that the choice process can enable urban parents to

select more diverse and well-resourced schools than that which is available in their current public districts. Besides magnet schools (which are under attack), few school choice plans require or enforce racial balance criteria. Some choice advocates, frustrated with school desegregation efforts that often placed the diversity burden on the shoulders of African American students or resegregated them into low-track courses once they enrolled in predominantly White schools, have started schools designed to serve racially homogenous student populations with a culturally centric curriculum.

Accountability

Because there exist so many different forms of school choice, assessing performance across them is difficult. The difficulty arises from a number of complex policy issues. First, state assessments differ from one another, making it difficult to compare achievement data across states. Researchers have tried to navigate this issue by examining student performance on the National Assessment of Education Progress. While this research is contested, preliminary analyses indicate that traditional public schools tend to slightly outperform private schools and charter schools serving similar populations. Second, there is not agreement on what constitutes a quality school. Consequently, some parents choose schools for their children even though the schools' academic performance is lackluster; they instead consider factors such as safety or school demographics. The third issue is related to the second one. Even among advocates, there is dissention about the purposes of school choice reforms. School choice goals include empowerment, innovation, competition, and equity. Outcome measures for these goals do not yet exist.

Therefore, school choice advocates tend to look favorably upon their preferred programs and consistently call for their expansion, while opponents advocate for their curtailment or complete eradication independent of student achievement data.

Outlook

Despite the political controversy and inconclusive research that often accompanies school choice, choice policies will likely continue to expand in the coming years. School choice is a key component of the No Child Left Behind Act (2001), in which

parents of students in schools designated in need of improvement or as unsafe are able to send their child to a better-performing public school or charter school. The George W. Bush administration provided millions of dollars to support the development of new charter schools and to support the advocacy activities of pro-school choice groups such as BAE0 (Black Alliance for Educational Options) and HCREO (Hispanic Council for Reform and Educational Options).

As philanthropists continue to subsidize the development of charters, vouchers, and small and alternative high schools, parents will be able to avail themselves of a number of school choice options, especially in major U.S. cities. African American parents in U.S. cities continue to clamor for better educational options and tend to be satisfied with their choice of charter, voucher, small and alternative schools, and homeschools. The questions about whether school choice reforms result in greater equity, empowerment, academic achievement, and student learning for African American children remain unanswered in any definitive way and require careful and ongoing study.

SCHOTT FOUNDATION BLACK BOYS INITIATIVE

The Schott Foundation Black Boys Initiative is a conceptual and operational framework a movement to improve African American male schooling, make high school graduation a certainty, and cultivate successful future citizens. Convinced that the state of African American male education warrants intensive and systematic focus, the foundation stepped forward with a detailed plan for improvement. Early indexes confirm the promising results that proceed from multi-stakeholder commitment to public education, especially for African American male youth. This entry describes how the initiative developed and operates.

Program Context and Origin

In 2001, members of the Cambridge, Massachusetts-based Schott Foundation for Public Education reviewed findings from a commissioned study on gender and academic outcomes in K–12 public education. The process proved pivotal in redefining the organization's focus and mission. Although pleased to learn about the progress of girls and young women in elementary and secondary settings, officials were troubled by dismal findings among African American males.

Nationally, for instance, African American males are overrepresented in special education programs, disproportionately disciplined, and under-enrolled in the most challenging academic courses and programs; too often, they do not graduate with their high school cohorts. The national reach of such challenges is detailed in the Schott Foundation report, *A Positive Future for Black Boys: Building the Movement*. Calculations based on the Schott Education Inequity Index (SEII) suggest that distressed outcomes primarily appear in areas such as New York City and Chicago, which have high concentrations of African American students.

To correct recurrent racialized and gendered gaps, Schott leaders undertook an ambitious set of goals in 2003 designed to improve this situation. Based on foundational work completed during inaugural meetings in New York City and Boston,

the need to (a) alter the political thrust and direction of the dominant culture and (b) revamp technology and modes of instruction emerged as guiding lenses through which Schott seeks to change the trajectories of African American males. A subsequent meeting at the Cantigny Conference Center in Chicago led participants to narrow their energies to effecting change in public policy, making use of new and existing community efforts, and stimulating public determination for change.

How It Works

The ways in which Schott hopes to animate and sustain its organizational goals echoes much of what educators, community organizers, and researchers have called for since the 1960s, such as devoting close attention to early childhood education programs, rethinking school financing, broadening the range of participant involvement in public education, and using community pressure to force measurable improvements in graduation and student discipline rates. Starting points and plans of action, both locally and regionally, may be mapped according to a series of worksheet templates available through the Schott Foundation. The nature of each template is described as follows:

- *Worksheet #1: Elements of Organizing* sorts out the role of involved factions, sets timelines, organizes research plans, and identifies appropriate work tactics.
- *Worksheet #2: Outreach Planning* pushes participant identification and the development of meaningful engagement options.
- *Worksheet #3: Assessment of Potential Allies* distinguishes among stakeholders, constituents, and associated groups that may be involved in or affected by advocacy strides.
- *Worksheet #4: Research* acts to guide forthcoming policies and practices based on empirical data.

The research strand of the Black Boys Initiative has proved fundamental in highlighting African American males' voices in dilemmas in which they are heavily affected.

For example, interviews conducted in conjunction with an Ohio pilot project assisted efforts to understand the spectrum of African American male

school performance. In the participants' collective view, success is driven by intellectual stimulation, college preparatory experiences, straightforward and nondiscriminatory discipline policies and practices, well-maintained facilities, interpersonal respect, and fidelity to teaching and learning. Low expectations, decrepit schools, and few course choices, in contrast, make underachievement predictable. Such observations by young African American men bring additional endorsement to claims that equity-minded individuals, particularly African Americans, have advanced for years.

Recent results from collaborative work in Ohio promises transformations in targeted areas. Along with the Ohio Department of Education, the foundation recognized three state high schools (Bowsher High School in Toledo, Brush High School in South Euclid/Lyndhurst, and Walnut Hills High School in Cincinnati) for strong student results and exemplary learning conditions. African American males in each school rank well on measures of achievement and are furnished with the needed opportunities to learn, such as access to well-developed libraries and expansive course offerings.

As a recipient of the Schott Awards for Excellence in the Education of African-American Male Students, each school may select an outstanding male African American graduating senior to be given a tuition scholarship for his freshman year at a state university (or equivalent). Schott, the KnowledgeWorks Foundation, and the Toledo Community Foundation provided funding for the tuition scholarships.

Certainly, scholars, researchers, educators, and policymakers have debated the need for and shape of civic reform efforts in the African American community for decades. Yet, the gendered overlay of race-conscious conversations is too often diminished in the academic and public consciousness. As a consequence, deliberate and collaborative decisions seldom place African American males at the forefront of education and school-based resolutions. The Schott Foundation Initiative is a critical step in reshaping conversations about public education.

SCIENCE EDUCATION

For several decades, institutional reports on the performance of U.S. students in science, from elementary school to postsecondary studies, have indicated underperformance for African Americans in general. Most recent reports show improvement for African American elementary students. The data from these reports are evidence of several challenges in science education. Programmatic efforts that nurture the development of African Americans in science, along with research that investigates and critiques the structures surrounding the underperformance of African Americans in science education, address some of these challenges. This entry looks at the current status of African Americans in science education, research in this area, and future projections.

Status of African Americans in Science Education

In 2005, the National Assessment of Educational Progress reported that, in comparison to previous

years, African American fourth graders had higher average science scale scores and a higher percentage of students performing at or above basic competency. The average scale scores rose from 120 in 1996 to 129 in 2005. The percentage of students performing at or above basic competency increased from 29% in 1996 to 38% in 2005, but only 5% and 8% of the students performed at or above the level of proficiency in 1996 and 2005, respectively.

The performance patterns of African American eighth graders in 1996 and 2005 were similar to those of the fourth graders. African American eighth graders averaged 121 on the measures in 1996 and 124 in 2005, and the percentage of students demonstrating at or above basic competency increased from 23% in 1996 to 28% in 2005, with a very small percentage (5% in 1996 and 7% in 2005) scoring at the level of proficiency. At the 12th-grade level, the performance of African Americans decreased from 1996 to 2005, with average scale scores dropping from 123 to 120; the percentages for performing at or above basic understanding dropped from 23% to 19% and for performing at or above proficiency dropped from 3% to 2%. The underperformance of African Americans in precollege science is reflected in the procurement of bachelor's, master's, and doctoral degrees in related fields.

Whereas African Americans made up 12% of the U.S. population and 12.5% of fall 2004 college enrollments, they were underrepresented in the conferral of degrees in science and engineering. In 2003–2004, approximately 5%, 6%, and 8% of African Americans received bachelor's degrees in engineering, physical sciences and science technologies, and life sciences, respectively. One fourth of those with bachelor's degrees in the sciences graduated from historically Black colleges and universities (HBCUs). In comparison to bachelor's degrees, a lower percentage of African Americans received master's and doctoral degrees in science and engineering.

About 3% of master's degrees and 2% of doctorates were awarded to African Americans in engineering; 2% received master's and doctoral degrees in the physical sciences and science technologies; and 6% and 3% received master's and doctorates, respectively, in life sciences. Over the past several decades, colleges and universities have implemented various recruitment and retention programs to

increase the number of African Americans pursuing science and science-related degrees.

Programmatic Efforts

Programs for the recruitment and retention of African Americans in the sciences differ in the age of those who participate but are very similar in the services they offer. Programs with undergraduate students among their participants offer financial assistance, structured research, and other opportunities for students to interact with mentors in the sciences, and provide early guidance in understanding the intricacies of postundergraduate studies. Some of the college- and university-based programs begin working with students as early as middle school. These programs often provide out-of-school science experiences like summer institutes and weekend excursions for the participating youth.

The encouragement, access to material and human resources, and mentoring that the student participants in these science recruitment and retention programs receive often continue after they begin advanced studies in the sciences and secure jobs in industry. These programs that report laudable successes regarding the recruitment and retention of African Americans in the sciences are largely absent in a systematic, institutionalized way in K–12 settings. As noted in the research in science education, comparable efforts are needed for improving the state of precollege science education for African Americans.

Research in Science Education

In their critiques of equity, excellence, and access in precollege science for African Americans, scholars have identified and discussed numerous structures that negatively affect the performance of African Americans. Various barriers limit the opportunities for African Americans to have high-quality learning experiences in science. These inhibiting structures include but are not limited to science curricula, teacher quality, and teacher expectations.

Research has highlighted the impact of course-taking patterns and the curricula of those courses upon the performance of African Americans in science. African American students' limited access to the necessary prerequisite mathematic courses for

rigorous studies in precollege science and limited enrollment in advanced placement (AP) science courses (only 4% of AP test takers were African American in 2004) adversely affect pursuits and participation in science at and beyond K–12 schooling. Racial disparities in the locales where AP courses were offered and in enrollments of African American students in AP course offerings situated in schools heavily populated by African Americans have been documented. The advanced placement courses are typically the sites of high-quality science experiences (for example, problem solving, scientific inquiry, use of technology) and are usually taught by high-quality teachers.

In accordance with federal and state guidelines, the quality of teachers is generally determined by the number of years of teaching experience, the extent of undergraduate and graduate science coursework, and performance on teacher licensure examinations. Teachers with 5 or more years of experience, who have undergraduate or graduate degrees in the subjects in that they teach, and whose performance on certification examinations exceed a specified cutoff score are considered high-quality teachers. In contrast, low-quality teachers have less than an undergraduate minor in the subjects they are assigned to teach, are not fully certified in the relevant subject matter, and have less teaching experience than their more experienced and more knowledgeable high-quality counterparts.

Larger percentages of teachers with the previously described low-quality profiles teach science in schools predominated by students from minority groups. Administrators often assign these teachers basic science courses that are typically taught as part of the vocational and standard academic tracks—the educational tracks in which African Americans are disproportionately represented. The science instruction in the vocational and standard academic tracks can be characterized as back-to-basics in which drill and memorization constitute both the means and ends of learning and reflect low teacher expectations.

Research conducted in large public urban school districts in United States, settings in which a disproportionate number of African American students are educated, has indicated that teachers' expectations for African American students and their abilities to excel in science are lower than the expectations they have for their White or Asian

American students. Because teachers with low expectations do not believe African American students can and do excel in science, they restrict the students' exposure to remedial science curricula and science instruction that does not nurture the higher-order cognitive functioning that is necessary for studies in the sciences. In addition, these teachers do not provide academic support and feedback that prepares students for future participation in science, and they do not offer the encouragement that facilitates the persistence needed in pursuing science degrees. Altering teachers' low expectations for African Americans is the focus of some research in science education.

In addition to the goal of highlighting the structures that inhibit the performance of African American people in science education, recent research replaces the deficient paradigm from which African Americans have been traditionally viewed. A more recent strand of research in science education employs a perspective that esteems what African Americans bring to the science classroom. The basic tenet of culturally relevant pedagogy—using cultural referents to facilitate learning—is employed in the domains of language and in expressive cultural styles like communalism, movement expressiveness, and verve in the teaching and learning of science. This direction in science education research is recent, and much work remains.

Future Directions

Science education, viewed as a civil rights issue by some, heralds a call to action. In order to effect substantive change in the precollege science experiences of African American students, research and programmatic undertakings currently located in higher education must culminate in joint endeavors that begin very early in the schooling of African American students. Concerted attempts in the early grades may create the conditions in which the performances of the low percentages of African Americans who have successfully matriculated through the sciences can be replicated. It is unnecessary for the success stories of various programs and HBCUs that notably contribute to the U.S. science pipeline to remain exceptions; these successes can be the rule.

SELF-ESTEEM

Researchers and social scientists have long possessed an interest in the effects of discrimination and its impact on the development of self-esteem in African American children. Most early studies concentrated on the self-esteem differences between African American and White children and posited higher degrees of self-esteem in Whites. It was believed that the African American experience with oppression, legal segregation, and racial discrimination contributed to the children's low self-worth. The 1954 *Brown v. Board of Education, Topeka, Kansas*, ruling was very significant, and although it supported this argument, it also sparked an intense interest and encouraged

further research in this area. Contrary to earlier views, most African American children who are educated in separate school settings possess higher degrees of self-esteem than Whites.

Self-esteem is the evaluation an individual makes about his or her own personal self-worth (personal self-esteem). It is a direct reflection of one's personal belief in his or her virtue, value, and competence. Self-esteem is often seen as the emotional grounding of the "self" and includes an individual examination of how one values his or her identifiable group (group-based self-esteem).

Self-esteem has always been and continues to be an important element in the development of African American children. The importance of feeling good about yourself, family, and community, valuing self and your abilities, and taking pride in all that you do are lifelong lessons that are handed down. African American children often receive such esteem training at an early age. Self-awareness, cultural awareness, knowing yourself, and valuing your heritage are a few examples of the common themes of the vital esteem training. These lessons are deemed useful survival tools to the young as they become of age and begin venturing outside of their protective communities. African American adults, having experienced adversity from dominant society, are mindful of the strong destructive forces the youth may encounter in society given their assigned (inferior) status.

It is believed that the self-esteem of African American children is directly influenced by a long history of discrimination and exclusion. Exclusionary practices are embedded in the historical fabric of the African American plight in the struggle for equal rights and equal access. Prior to the *Brown v. Board of Education* ruling, laws in southern states forced African Americans in those states to live in a separate, segregated, unequal society from that of Whites. African Americans lived a life of subordination, forbidden to enter or occupy the same public facilities as those of White citizens (de jure segregation). African American children were required by law to attend separate schools packed into small overcrowded, rundown buildings with limited funding, books, and other needed supplies; while White students attended large, well-kept and newly built schools that were well equipped with resources and funding. The culture of the northern states also supported the practice of

segregation by assigning African American children to separate buildings, classrooms, and seating arrangements (de facto racial segregation, or segregation by custom).

In this light, previous research had concluded that African Americans manifested low levels of self-esteem relative to Whites. Although the *Brown* decision succeeded in ending legal segregation in the southern states, it had very little impact on changing the culture of segregation. African Americans continued to experience blatant and overt acts of discrimination and racism. Discriminatory laws were erased from the books; however, the norms of society (thoughts, beliefs, and feelings about African Americans) remained intact. The school environment was a direct reflection of how society viewed and valued its African American citizens.

Although the *Brown* decision gave African Americans access to better schools and what was thought to be access to equal educational opportunities, it proved to be anything but equal. The mixed school environment was the breeding ground that cultivated and supported the ideology of racial discrimination, exclusion, and oppression, an environment that stifled the confidence and self-esteem of African American students. African American students in mixed school environments are more likely to experience racial insults, putdowns, feelings of powerlessness and isolation and are less likely to receive support and encouragement from teachers and staff. African Americans are less likely to lead or head teams or councils and in some cases may be forbidden to participate in extracurricular activities with Whites. In this environment, Whites, whether students, parents, teachers, and staff resented the very presence of the African American child who visually looked different with his or her brown skin color. In most cases, Whites in this environment went out of their way to make the African American students uncomfortable. It is in this sort of environment that African American students struggle to establish a strong sense of self.

In contrast, the educational experience for students in the segregated environment is more positive because their skills and abilities are valued; they feel a sense of belonging in a safe nurturing environment in which they attend school with their peers, and they are more likely to be instructed by teachers that share their same culture.

African American students in predominantly African American school settings have a stronger sense of self than do students in desegregated schools. More-recent studies reflect that African American students in desegregated settings tend to compare themselves to their White peers, while in segregated settings they display higher levels of confidence because their self-assessments are made solely within their peer group. These findings challenged prior studies that reported African Americans manifesting lower levels of esteem than Whites.

SELF-FULFILLING PROPHECY

A self-fulfilling prophecy occurs when an initially incorrect expectation leads the person holding the expectation to behave in ways that serve to elicit the expected outcome. Self-fulfilling prophecies can be *interpersonal* in nature, as when a teacher's erroneous belief that a student is not very bright leads the teacher to provide less challenging material to the student, resulting in an overall lower achievement level for the student. They can also be *intrapersonal* in nature, as when a person's belief that he or she cannot succeed at a given task leads him or her not to attempt it, thus guaranteeing a lack of success.

In both senses, self-fulfilling prophecy research has serious implications for African Americans. Interpersonal studies have shown that teacher expectations about students—including their low expectations of African American or poor students—have an impact, through their affect and effort, on student achievement. More seriously, intrapersonal studies of a phenomenon known as “stereotype threat” have shown that merely reminding African American students of their race may have a negative impact on their work. This entry begins with an overview of research on self-fulfilling prophecies, then looks more closely at work on teacher expectations, the behavioral mediation of teacher expectancy effects, and stereotype threat processes.

Classic Examples

A classic example of a self-fulfilling prophecy is the bank failures that were common during the Great Depression: A rumor would circulate that a given bank was about to fail, and people holding accounts at the bank would rush to withdraw their funds. Because banks do not keep enough cash on hand to cover all deposits, the unexpected demand for withdrawals would result in the failure of the bank. A more recent and humorous example of self-fulfilling prophecies occurred when Johnny Carson announced on his popular late-night talk show that there was an imminent nationwide toilet paper shortage. Although he was merely joking, enough people believed the story that they went out and stockpiled toilet paper. The unanticipated demand quickly exhausted the normal supplies of toilet paper at local stores, culminating in, yes, a nationwide toilet paper shortage.

Note that both of these examples possess the essential characteristics of a self-fulfilling prophecy: They start with an initially *incorrect* belief, and this belief causes the individual holding it to behave in such a way as to bring about the (initially incorrect) expected set of events.

Experimental Research

In the realm of psychology, research on self-fulfilling prophecies had its start with Robert Rosenthal's program of research on experimenter expectancy effects. In a series of studies that numbered in the

hundreds, Rosenthal and others showed that experimenters' expectations that participants' behavior would support their hypotheses could act as self-fulfilling prophecies.

In a prototypical example of a study in this area, a sample of experimenters was told that they would be replicating the well-documented phenomenon that rats could be selectively bred to perform either very well or poorly on a maze-running task. The experimenters were led to a room containing cages of rats, and each rat had a label affixed to the cage identifying it as being either a specially bred "maze-bright" or "maze-dull" rat. In reality, the rats were standard laboratory rats and had not been specially bred; instead, the labels had been randomly assigned. Analyses showed that those rats that had been randomly labeled "maze-bright" did in fact run the maze significantly faster than rats labeled "maze-dull," presumably as a result of different handling by the experimenters.

The uncomfortable implication of this and other studies on experimenter expectancy effects was to call into question the validity of nearly all experimental research involving human participants: Perhaps experimenters were obtaining their results not because their theories were correct but because they were unconsciously biasing their behavior to elicit the results they expected. Fortunately, a solution to the potential biasing effects of experimenters' expectations is easily available.

All that is needed to prevent experimenter expectancy effects from occurring is to adopt a *double-blind* procedure, where neither the participants nor the experimenters themselves are aware of the experimental condition of the participant. If experimenters do not know what kind of behavior to expect from a participant, they cannot possibly unconsciously bias their behavior to obtain the expected behavior. Today, the double-blind study remains the gold standard of experimental design in all areas of research.

Teacher Expectancy Effects

As work on experimenter expectancy effects progressed, Rosenthal and others began to wonder about other interpersonal domains where self-fulfilling prophecies might be operating, and education was an obvious choice. In 1968, he and Lenore Jacobson conducted the famous "Pygmalion in the Classroom" study. The researchers administered the

"Harvard Test of Inflected Acquisition" to all the students at an elementary school. They told teachers that this test would identify those students who could be expected to demonstrate significant gains in academic achievement during the upcoming year. Teachers were then given a list of names of students in their classes who had thus been identified as academic "bloomers."

In reality, there is no such thing as the Harvard Test of Inflected Acquisition; what was used was standardized test of intelligence. Moreover, the students identified as academic bloomers had been randomly selected from the class rolls. At the end of the school year, all students were administered the intelligence test again. Analyses showed that those students who had been labeled academic bloomers did in fact show significant gains in IQ, especially those in the first and second grades.

The Pygmalion study sparked considerable controversy due to its troubling implication that perhaps some children do poorly in school not because they lack ability or motivation but because their teachers do not expect them to do well. This implication was even more troubling for the African American community, because there is considerable evidence that teachers are likely to hold lower expectations of African American children than of White students.

As was the case with the experimenter expectancy effect literature enough replications were conducted to persuade most skeptics that teachers' expectations can act as self-fulfilling prophecies, and that these effects are of a magnitude that can yield socially important consequences. Researchers in this area are not arguing that teachers' expectations are the sole or even primary determinant of academic achievement. As Lee Jussim has convincingly argued in his Reflection-Construction Model, the component of variance in teachers' expectations that is due to accurate judgments of students' ability is larger than the component of variance due to erroneous estimations of ability. However, one could also argue that *any* negative self-fulfilling effects because of teachers' unwarranted low expectations for a student are a social injustice.

Mediation of Teacher Expectancy Effects

One of the most intriguing topics in understanding teacher expectancy effects is the question of "expectancy mediation," or the underlying behavioral

processes that occur in communicating the teachers' positive or negative expectations to their students. While the behaviors that communicate expectations are undoubtedly specific to the context being studied, Rosenthal and colleagues proposed that mediators of expectancy effects could be categorized under the two general dimensions of *affect* and *effort*.

Affect Dimension

The affect dimension refers to behaviors associated with the socioemotional climate of the teacher. Most of the behaviors are nonverbal in nature and take place outside the conscious awareness and control of the teacher. For example, when engaging students about whom they hold positive expectancies, teachers will smile more, engage in more eye contact, touch the student more, and use a warmer tone of voice, as compared with their approach to students for whom they hold low expectancies.

Again, these behaviors are primarily nonverbal and largely outside the conscious control of the teacher. All teachers will say that they strive to treat their students equally warmly and that it would be unfair to let one's personal liking or disliking for a student affect how the student is treated. However good a teacher's intentions may be, though, the reality is that affect leaks out in nonverbal behavior in subtle ways that affect the recipient of the behavior. Consider, for example, the likely reaction of a student to the words, "What do you want?" said in either a bright, cheerful tone of voice versus a sharp, exasperated tone of voice.

The type of feedback provided students also falls under the affect dimension. Teachers who hold positive expectations of their students tend to praise these students more and criticize them less; there is also evidence that they provide more differentiated feedback (that is, pointing out strengths and weaknesses of the student's performance rather than a vague "good job").

Effort Dimension

The *effort* dimension is the second major category of mediating behaviors. This dimension refers to aspects of teaching behavior that relate to the amount of material taught, as well as response opportunities provided to the student. Specific behaviors falling into this category include difficulty

level of material taught, amount of time spent with student, asking questions of the student, and calling on the student to respond. The sheer amount and difficulty level of the material taught is perhaps the most pernicious mediator of teacher expectancy effects: It doesn't matter how capable a student is; if the teacher does not think he or she is capable of learning material at a given level and as a consequence does not attempt to teach it, the student by necessity will not learn it.

This dynamic is one of the central arguments offered against the practice of tracking by ability levels in school. There is ample evidence that African American students are disproportionately placed in lower tracks and/or special education classes. To the extent that these placements are not warranted by the students' academic aptitude or are prompted by conscious or unconscious bias, the students may find themselves doomed to a cycle wherein they are not taught appropriately challenging material and thus are unable to move out of the lower tracks.

Stereotype Threat and Academic Disengagement

Research on teacher expectancy effects focuses on self-fulfilling prophecies at the interpersonal level: A teacher's expectations, positive or negative, about certain students lead him or her to treat those students differentially. This differential behavior affects the students to result in either heightened or lowered performance. Self-fulfilling prophecies can affect African American students' education in another important way, namely, acting as an *intrapersonal* phenomenon. If students have expectations (either high or low) for their own academic performance that do not correspond with their current abilities, this may affect their motivation and effort to the extent that the expected outcomes (either positive or negative) come to pass.

The possibility of intrapersonal self-fulfilling prophecies has been examined in recent years primarily with respect to the exciting research on *stereotype threat* or *stereotype vulnerability* introduced by Claude Steele. Stereotype threat refers to the psychological threat that is experienced by members of stigmatized groups when they are in a context in which they are aware that others are negatively

stereotyping them. For example, most African Americans are aware of the stereotype held by many people that they are not as intelligent as Whites. Steele argues that being aware of this stereotype produces anxiety in African Americans when placed in academic contexts, such as taking a standardized test of achievement, and that this anxiety can interfere with subsequent performance.

In one of the early demonstrations of this effect, Steele and his colleague, Joshua Aronson, had African American and White students at Stanford University complete a test consisting of difficult items adapted from the Graduate Record Exam (GRE). Prior to taking the test, stereotype threat was manipulated by telling half of the students that the exam was diagnostic of their intellectual ability; the remaining students were told that the exam was merely a problem-solving task designed for the laboratory experiment and was not diagnostic of ability. Analyses of the resulting performance on the test (adjusted for students' Scholastic Aptitude Test (SAT) scores indicated that when the test was described as being nondiagnostic, Black and White students scored similarly. However, when the same test was described as being diagnostic of students' intellectual ability, Blacks scored significantly lower than Whites.

Even more compellingly, in a second study, Steele and Aronson had some participants indicate their race prior to taking the test, whereas the other participants did not. When race was primed, again the African Americans scored lower than the Whites, after controlling for SAT scores, whereas no difference was found when race was not primed. The implications of this result are both mind-boggling and profound: Something as trivial as merely checking off the appropriate category on a "race" box can have statistically significant effects on test performance. Yet what is one of the first things that test takers do when taking a standardized test such as the SAT or GRE? Fill out a demographic section asking for information such as race or gender.

In sum, stereotype threat research is critically important for the field of African American education because it provides an alternative explanation to account for the well-documented racial gaps in standardized test performance between African Americans and Whites. In addition to the traditional explanations of this gap, such as teacher bias, poorer quality

schools, or less or poorer preschool preparation, the concept of stereotype threat offers an intrapsychic explanation in which the mechanism for underachievement is a self-fulfilling prophecy.

The basic stereotype threat finding is robust and has been replicated across a variety of domains, including gender stereotypes; for example, women who are reminded of the gender gap in performance on mathematics tests do less well on a subsequent math test than women who are not reminded of the gender gap. Subsequent studies have concentrated on identifying the cognitive and behavioral mediators of stereotype threat effects. The primary process appears to be that stereotype threat causes emotional distress and disruptive pressures such as evaluation apprehension, test anxiety, self-consciousness, and distracting thoughts.

Scholars in this area stress an important point: Stereotype threat has adverse effects primarily for those individuals who are identified with the domain being stereotyped. Identification with a domain means that the individual feels that he or she has the abilities, skills, and resources to do well in the domain and in essence "belongs" in the domain. It is thus a sad irony that the people who care most about doing well in a domain will be the ones most threatened by knowledge of cultural stereotypes that suggest that their group underperforms in that domain.

A further troubling implication is that one way to avoid stereotype threat is to become disidentified with the domain, so that one's sense of self is not contingent on doing well in the domain of question. Steele and others argue that this process accounts for a significant portion of academic disengagement seen in African American youth. Of course, this strategy also has self-fulfilling consequences of ensuring that the individual never reaches his or her potential in that domain.

SERRANO V. PRIEST

Serrano v. Priest (1971) is a long-standing challenge to state school finances premised on violations of federal and state equal protection clauses as they relate to schools. At its core was the question of whether the State of California's school funding scheme violated federal and state equal protection clauses because the continuum of school funds available to districts as a result of the state funding formula predicated on local property taxes. Although its authoritative power is confined to California, *Serrano* is a pillar and exemplar in school finance literature because of its illustration of a successful state equal protection challenge.

School finance litigation is core to an understanding of revolutionizing developments in the history of public schools. After *Brown v. Board of Education of Topeka, Kansas* (1954), school reformers confidently began to address fiscal disparities in federal and state courts based upon equal protection challenges, with hopes of rendering a *Brown*-like verdict. Reformers theorized that wealth disparities among school districts amounted to wealth discrimination that could only be upheld if the government's reasoning for doing so survived a strict scrutiny analysis. This entry describes the sequence of events surrounding the *Serrano* case and discusses the ruling's subsequent influence.

Facts of the Case

The plaintiffs in *Serrano* were schoolchildren enrolled in the Los Angeles County public schools and their parents. They brought a class action suit against state and county school officials responsible for the California public school finance scheme. The plaintiffs claimed to have represented all public

school students in California except those children who experienced the best educational opportunity of all school districts in the state.

The California public school system was primarily financed by local property taxes and then supplemental state funds, which resulted in a variation of funds available to school districts according to the local community in which the school district was located. Essentially, the parents' core argument was that the financial scheme made quality education a function of the wealth of each community, irrespective of the children's educational needs. The state provided a foundation program that resulted in a flat grant per child being given to each district, as well as equalization aid based on district need and supplemental aid to subsidize districts that were willing to increase their local tax base. Nevertheless, a wide continuum still existed in the funding available to school districts.

As such, the plaintiffs argued that the wide discrepancy in the quality and degree of educational resources available to the school districts violated the equal protection clauses of the U.S. Constitution and the California Constitution. Second, the plaintiffs believed the financing scheme forced them to pay higher taxes than other school districts in order for their children to experience equal or lesser educational opportunities than were available to students in the other districts. The plaintiffs' third and final complaint alleged that the dispute challenged the validity and constitutionality of the funding scheme in accordance with the U. S. Constitution and the California Constitution.

The parents, on behalf of their children, sought to have the California public school financing scheme deemed unconstitutional; have school officials reallocate school funds to alleviate the aforementioned concerns; and have the trial court retain jurisdiction of the matter so that it might make the necessary alterations if the defendants and the state legislature did not do so in a reasonable time.

The Court Ruling

Given the aforementioned facts, the Supreme Court of California began its analysis by addressing the appropriate level of scrutiny to be relied upon. In accordance with traditional equal protection clause analysis, a particular level of scrutiny is applied

depending upon the type of discrimination in question. The court determined that the applicable legal standard was that of strict scrutiny. The court considered the issue to be one touching upon a suspect classification because the heart of the matter surrounded plaintiffs' wealth. Like racial classification, wealth classifications are closely examined and generally frowned upon because the government has very few compelling reasons to discriminate based upon such characteristics.

Applying the strict scrutiny standard, the court decided that the school financing structure discriminated on the basis of a district's wealth even though such discrimination was not purposeful. Next, the court decided that education is a fundamental interest given its eminent role in U.S. democratic society. The court's final task was to determine whether such discrimination was necessary to accomplish a compelling interest. The state's interest that was at stake was the state's goal to make local communities responsible for the education of their children. In light of this central goal, the court was not convinced that the existing school funding scheme furthered this interest even if it was a compelling interest.

The court was unwilling to sanction a funding scheme that resulted in a quality education that was positively correlated to wealth of a community. The court believed the state could accomplish its goal of local administration and fiscal control of education in a less discriminatory manner. In addition, ironically, the court thought the adopted financial scheme hindered the state's goal of local fiscal choice, because poor districts had limited choices given the lack of funds accrued from local taxes.

Thus, the California public school funding scheme was found to be in violation of both the U.S. Constitution and the California State Constitution.

Impact of the Case

Shortly after the California Supreme Court's ruling in *Serrano*, the U.S. Supreme Court in *San Antonio School District v. Rodriguez* (1973) rendered an opposite opinion on a parallel question of federal equal protection violations based on wealth discrimination by public schools in Texas. Unlike the California Supreme Court, the U.S. Supreme Court refused to hold the government accountable for

the economic variations in school district wealth of the surrounding community. As such, the federal, but not the state, claim that was championed in *Serrano* was overturned by the U.S. Supreme Court as the supreme law of the land.

Notwithstanding the federal stance articulated in *Rodriguez*, individual states continued to witness state challenges equivalent to that of *Serrano*. According to the National Access Network as of 2008, only five states—Delaware, Hawaii, Mississippi, Nevada, Utah—had not witnessed school finance litigation. In addition, state challenges have primarily shifted from arguments grounded in state equal protection clauses to whether states are providing a minimally adequate education as mentioned in state constitutional provisions. Adequacy challenges differ from equal protection challenges in that the former focuses on the level of state support given to school districts to provide the basic floor of education in accordance with state constitutional provisions, instead of a discrimination line of reasoning as with equal protection challenges. In South Carolina, for example, a group of poor rural school districts continued the adequacy fight by filing an appeal to *Abbeville v. State* (2005). Several of the school districts represented in the lawsuit are located along the Interstate 95 corridor. This region is often referred to as the "corridor of shame" because of its dilapidated educational conditions.

As public schools continue to weather various "movements" geared toward ensuring that all children are afforded the state defined appropriate education, school finance litigation continues to be a catalyst for change. The *Serrano* opinion ignited a flame that has not dimmed as students and parents from lower-socioeconomic communities continue to fight for funding that ensures that no child is left behind.

San Antonio Independent School District v. Rodriguez, 411 U.S. 1 (1973)

Serrano v. Priest, 5 Cal. 3d 584 (1971).

SINGLETON V. JACKSON MUNICIPAL SEPARATE SCHOOL DISTRICT

In an effort to convert segregated schools in the United States that were part of dual school systems into desegregated ones that were part of unitary systems, the courts encouraged the merger of students, faculty and staff, transportation systems, and even extracurricular activities. The U.S. Supreme Court in *Brown v. Board of Education, Topeka, Kansas* (1954) held that the racial segregation of students was inherently unconstitutional and ordered all public schools to convert to a unitary system with “all deliberate speed.” However, some states remained defiant and refused to comply with the Court’s order. In other states, the attempts to merge schools into a unitary system were not effective when the implementation was resisted and drawn out over many years. This entry describes the back story, the effect and the impact of the Singleton case.

In *Singleton v. Jackson Municipal Separate School District* (1970), the court recognized that, although previous cases had ordered the abolition of dual educational systems and the creation of unitary ones, the courts had failed to provide the states and school districts with the guidelines needed to fully comply with the law. Hence, the *Singleton* court provided a process plus a target date by which school systems in its circuit should be operating under a unitary system.

The first requirement for creating a unified school system included several preliminary procedures. This included the transfer or reassignment of faculty and staff and the reconstructing of bus routes to remove racial segregation and to maximize student integration within the school system. The school board was further required to make publicly available, upon request, a record of any objective evaluation procedures used to move faculty and students around in

the school district. These procedures were designed to facilitate and make orderly the major challenge of transitioning students into a unitary system.

The *Singleton* case also tied qualification for federal financial assistance to desegregation of faculty and staff. Additionally, a failure to desegregate the school system would result in employment benefits being waived or even dismissal. Connecting faculty desegregation to federal aid meant desegregation was no longer within the state’s discretion or control; the level of desegregation was, rather, a necessary and required step for measuring whether the constitutional rights of African American children had been protected as *Brown v. Board of Education* decreed.

The *Singleton* court laid the groundwork for what is known today as affirmative action. Affirmative action policies have been used in many areas, officially and unofficially. It has benefited people of all races, ethnicities, and national origins in employment opportunities, school admissions, and job promotion opportunities.

Historical Context

In the landmark case of *Brown v. Board of Education*, the U.S. Supreme Court unanimously held that the racial segregation of students was inherently unconstitutional because it denied equal protection under the Fourteenth Amendment. In *Brown*, the Court acknowledged education as the most important function of state and local governments and the very foundation of good citizenship. The Court recognized that the education of Whites was largely in the hands of private groups, while the education of African Americans was almost nonexistent. The Court held that separating of students solely due to race is inherently unequal and may affect the hearts and minds of those deemed excluded by generating feelings of inferiority. Therefore, the Court in *Brown* ruled that segregating students based on race was inherently unconstitutional.

However, even 15 years after the *Brown* decision, public school districts were still operating segregated schools despite the Supreme Court’s mandate to desegregate. Then, the U.S. Supreme Court held in *Alexander v. Holmes County Board of Education* (1969) that school districts were required to operate as a unitary school system, effective immediately. Moreover, the decision in *Alexander* precluded, as

impermissible, any additional delay in implementing a unitary system. The conversion to a unitary system was required to take place no later than December 31, 1969. The decision in *Alexander* supervened all existing authority to the contrary.

Although *Alexander* provided school districts with a deadline for the conversion to unitary systems and mandated expediency, the court failed to identify the process to be used to accomplish this complex transformative objective. This was a major oversight given the resistance it engendered. However, *Singleton v. Jackson Municipal Separate School District* did provide a process.

Facts of the Case

The appeals court, in *Singleton*, had already heard 13 cases from various school districts in the Fifth Circuit when the *Alexander* case ruling came from the Supreme Court establishing guiding precedent for desegregation cases. The *Singleton* court considered all 13 cases anew. It subsequently concluded that because there were no plans in place to merge the segregated schools it would be difficult to achieve a unitary system before fall of 1970, as *Alexander* required. So, although the appeals court extended the deadline set forth in *Alexander* to a later date, it still required the school districts to use specific processes to expedite the implementation of a unitary system. First, the school district would set forth all the prerequisites necessary to convert to a unitary system by February 1, 1970. Second, the merger of segregated student populations into one student population had to be done before the 1970 fall term.

The first step required a redistribution of faculty and staff members, so that the ratio of African American to White teachers and staff members in each school remained consistent with the ratio of African American to White teachers and staff in the entire school system. This redistribution was necessary in order to prevent any school being viewed as strictly for Black students or White students. To the extent necessary to facilitate this merger and achieve desegregation, teachers and staff were required to accept new assignments as a condition of continued employment. Furthermore, staff members and administrators who worked directly with children were to be hired, assigned, promoted, paid, demoted, and dismissed without regard to race, color, or national origin. The dismissal or demotion

of any staff member required their resulting vacancy to be filled by a person of the same race, color, or national origin. *Singleton* also required, as mentioned earlier, open records concerning the school board's standards and criteria used in the hiring, demotion, or dismissal of any faculty. The *Singleton* ratio was to become the standard used to measure the extent of faculty desegregation.

Additionally, *Singleton* implemented student transfer policies that would permit a student attending a school where his or her race was in the majority to transfer to a school where his or her race was in the minority if space was available. The *Singleton* court also mandated that the school district's transportation system be completely and regularly reexamined to ensure it was operating in a nondiscriminatory basis. And, finally, school construction sites were also to be reviewed regularly to ensure reemergence of the dual school structure did not occur.

Singleton's order to desegregate immediately by fall 1970 necessitated a timeline being established and followed closely. It ordered the school districts to file desegregation plans with their district courts by January 6, 1970, and gave the district courts until February 1, 1970, to enter a final order. If a school district did not submit a plan or submitted an unsatisfactory plan, the district court was then authorized to design a plan consistent with the requirements set forth by *Singleton*.

Once all procedural matters were established, the *Singleton* court applied the foregoing requirements to each of the 13 cases that had been consolidated in the appeal. All 13 cases were reversed and remanded, requiring full compliance with *Alexander*. Assigning students to schools on the basis of achievement test scores could not be employed in any event until unitary school systems had been established. In *United States v. Matthews* (1970), a unitary plan was approved by the district court and appeared to be realistic and workable. Although the desegregation plan was approved and implemented, it did not produce a unitary system. A system operating on a freedom of choice plan produced impressive results but fell short of establishing a unitary system.

Impact of the Ruling

The *Singleton* decision accomplished the desegregation plan proposed in *Brown*: compelling school

districts to take immediate steps to desegregate the school systems. After *Singleton*, school districts were no longer able to delay the implementation of unitary systems through inadequate or modified plans. They had to follow the law.

Although the *Singleton* order to immediately implement unitary systems was slated to be successful, the court recognized that such an order would be disruptive. In their view, it would likely reduce total school personnel because it would eliminate duplicative jobs and cause some school faculty to refuse reassignment to a new school or to refuse to travel the new distance to work. The court's protection plan to help school districts cope with such consequences yielded the "*Singleton* rights," which did help mitigate some problems.

Singleton rights were like affirmative action policies; they sought to minimize a hardship not directly the fault of the victims. They were preferences, or "recall rights," in favor of those teachers and staff members who inevitably would be displaced because of the court order. *Singleton* rights served as a remedy only for teachers who were dismissed during a desegregation process. Thus, teachers and staff members could no longer seek protection under the *Singleton* rights if the school had already achieved a unitary system. Additionally, *Singleton* rights applied as a remedy only if job loss resulted from desegregation policies. It did not apply when poor performance in the classroom, lack of professional credentials, and/or a failure to abide by school regulations caused job loss. Because the desegregation plan established by *Singleton* was adapted by several school districts, the *Singleton* rights covered many displaced staff members in schools that were desegregated.

There were problems with the *Singleton* rights. Even 15 years after *Singleton* was decided, there was uncertainty as to the level of protections afforded to displaced teachers and staff members. While some courts limited the application of *Singleton* rights to cases in which desegregation directly led to a reduction of school staff members, other courts did not. In fact, some courts actually applied *Singleton* rights as though they were legal rights, not linked to a desegregation order. Compare *Campbell v. Gadsden County District School Board* (1976), which implicitly limited *Singleton* rights to court-ordered desegregation, to *Lee v. Macon County Board of Education* (1971), which

held that *Singleton* rights embody a core of substantive rights that, unlike its procedural aspects, may attach retroactively. In *Hardy v. Porter* (1977), it was ruled that *Singleton* entitlements are not constitutional rights.

Later, several cases following *Singleton* addressed deficiencies in its holding. For example, in Jefferson County, Kentucky, a metropolitan school district in the city of Louisville, *Singleton* was interpreted to require the district's schools to each maintain a percentage of minority faculty members between 7% and 22%. This percentage would be a part of the minority composition of the total teaching force at the elementary, middle, and high school levels in the district. Thus, faculty diversity across Jefferson County was realized, although not limited to its previous allocation of 84% White teachers. Soon, however, other problems associated with *Singleton* became apparent.

Urban school populations became increasingly African American. White populations were fleeing to suburban areas in order to resist desegregation plans. The Louisville urban schools in Jefferson County answered this challenge by proposing a consolidation of county schools. Suburban Jefferson County schools on the other hand, opposed this consolidation of schools. In another effort to address urban residential segregation and its impact on desegregation efforts, the U.S. Supreme Court ruled in *Carter v. West Feliciana Parish School Board* (1970) that the *Singleton* ratio could be modified if the district used a non-discriminatory, objective and meritorious standards in selecting faculty.

In *Spangler v. Pasadena City Board of Education* (1970), the court required school authorities to make equitable distributions of teachers and staff members based on the individual's experience and training. The *Spangler* court held that the existing system violated the equal protection clause because it assigned teachers with less experience and training to schools with predominantly African American enrollments. Further, in *Johnson v. San Francisco Unified School District* (1971), the court held that the full benefits of desegregation cannot be achieved merely through "meeting of arithmetical percentages on racial balance."

In short, *Brown*, *Singleton*, and their progeny did not address de facto segregation but only de jure segregation. De facto segregation was not addressed

until 1973 in *Keyes v. School District No. 1, Denver, Colorado* (1973), in which the court recognized the need for a systemwide remedy that would address desegregation both in the North and South as well as in urban, suburban, and rural districts. In *Keyes*, Justice William O. Douglas saw no constitutional difference between de jure segregation and de facto segregation, “for each is the product of state actions or policies” (p. 216), as segregated schools often result from the actions and/or omissions of school boards or administrations and not through legislative decree. The court held as follows:

Where the school district is racially mixed and the races are segregated in separate schools, where black teachers are assigned almost exclusively to black schools, where the school board closed existing schools located in fringe areas and built new schools in black areas and in distant white areas, where the school board continued the “neighborhood” school policy at the elementary level, these actions constitute state action. (p. 216)

What is known today as affirmative action has been used as an additional method of redressing discrimination that has persisted in spite of civil rights laws and constitutional guarantees. It is really active measures taken to ensure that victims, in this discussion African Americans and other minorities, enjoy the same opportunities that they were unconstitutionally denied. Affirmative action policies apply to employment hiring (including veteran preferences), salary increases, school admissions, scholarships, and other benefits. With respect to African Americans and other minorities affirmative action encourages public institutions such as universities, hospitals, and government agencies to maximize diversity in all levels of society, as well as to redress the oppression and legacy of oppression minorities have suffered from de jure and de facto discrimination. Although affirmative action has been both praised and criticized as an answer to racial inequality, the U.S. Supreme Court has upheld the legality of affirmative action. Indeed, despite progress in eliminating de jure segregation, racial discrimination in the hiring, and dismissal of faculty and staff within public school systems still exists.

SLATER FUND

The Slater Fund was established by John Fox Slater, aiming to achieve the “uplifting of the lately emancipated population of the Southern States, and their posterity, by conferring on them the blessings of Christian education.” Although it was dedicated solely to the education of African Americans, the agents and trustees of the Slater Fund were part of an interlocking directorate of White architects of African American education who assumed leadership positions in the Jeanes Fund, the Phelps Stokes Fund, the Peabody Fund, the Rosenwald Fund, the General Education Board, and other major entities influencing African American education. They favored an industrial model of education, training African Americans for work in the trades, and a focus on religious principals.

Some attribute the establishment of hundreds of public schools and advances in literacy among southern African Americans from the 1890s to 1930 directly to the Slater Fund. Critics argue that the Fund philosophically and financially supported segregated schools where African Americans would learn only industrial and domestic skills. Still others lament that the Fund contributed mightily to a colonial model of African American education. This entry examines the history of the fund and assesses its impact.

Historical Context

Following the Civil War, the 17 defeated southern states that practiced enslavement were unable to properly fund public education and unwilling to fund African American education. Newly emergent northern corporate philanthropies committed finances to this end.

Millionaire textile manufacturer, commodities trader and financier George Peabody advanced industrial philanthropy in the mid 19th century. Jointly residing in the United States and England, Peabody’s earliest “gift giving” was directed to housing paupers in London. In 1867 he established the Peabody Educational Fund to assist educating the poor in the southern states. The Peabody Fund articulated a rationale, provided a model and trained leaders for educational philanthropy.

An advocate of industrial training for African American people, John Fox Slater of Norwich, Connecticut established his philanthropic foundation in 1882. Inspired by the Peabody model, the agency was chartered in the state of New York with an initial gift of \$1 million. Unlike Peabody and other education foundations, Slater money was aimed at African Americans exclusively.

Powerful political and educational leaders were chosen to lead the effort. Former President Rutherford B. Hayes chaired the initial governing body. Early trustees included Morris K. Jessup, a New York banker and benefactor to George Washington Carver; Daniel Coit Gilman, well-known educator and former president of Johns Hopkins University; William Slater, John’s son; Atticus G. Haygood, a Methodist minister and president of Emory University; Wallace Buttrick, a minister active in the charity movement; and Dr. James H. Dillard, an educator and college president.

Implementation

The Slater Fund’s first two general agents, Atticus G. Haygood, who served from 1882 to 1891, and J. L. M. Curry, 1891–1903, greatly influenced the racial views, political philosophy, and activities of the organization. The third general agent, Wallace Buttrick, 1902–1910, maintained Curry’s policies. The fourth general agent, James H. Dillard, 1910–1940, shifted the focus of the fund.

Haygood was a strong advocate of industrial training for African Americans. He believed African American men should be trained in farming, blacksmithing, tanning, carpentry, and brick masonry. Like other architects of African American education, he supported a curriculum for moral uplift. For Haygood, Bible study should be at the heart of character building. During the Haygood years \$322,000 was gifted. Of that amount, more than 90% went to private institutions with the remainder going to public schools.

Jabez Lamar Monroe Curry brought a lengthy resume to Slater. Reared in the Deep South and Harvard educated, Curry served in the Alabama State Legislature, U.S. Congress, and the Confederate Congress. Along the way he became an attorney, ordained minister, military officer, ambassador to Spain, and college professor. An arch-segregationist and staunch secessionist, Curry made his mark on

the old South as an accomplished orator, defender of enslavement, and indefatigable advocate for states' rights. Having previously served as general agent for the Peabody Fund, Curry further shaped Slater.

While Curry shared Haygood's educational and racial views, they differed in emphasis. Haygood wanted to train ministers to spread the philosophy; thus, he provided large financial allocations to churches. Curry believed the training of teachers was more effective. During Haygood's administration, 62.4% of the disbursements went to assorted colleges and universities, 9% explicitly to Hampton and Tuskegee, and 21.4% went to private secondary schools. In the Curry years, 51.5% of disbursements went to colleges, 36.7% went to Hampton and Tuskegee, and only 1.0% went to private secondary schools.

Wallace Buttrick acted as a caretaker general agent. He continued Curry's general direction. During his stewardship, 41% of the total disbursements went to colleges and universities, 35% to Hampton and Tuskegee, and 7.7% to private schools.

James H. Dillard gradually deemphasized distributions to Black colleges and universities in favor of assistance to the newly conceived county training schools. From 1910 to 1912, \$2,000 was distributed to county training schools. By 1930, that amount reached \$386,000.

By the late 1930s, the Slater Fund joined assorted philanthropies in the formation of the Southern Education Fund. Its legacy has been interpreted, applauded, and critiqued.

Historical Impact

Several observations can be made about the historical role of the Slater Fund. Beyond "gift giving" to African American educational projects, it was a political entity. The fund engaged and employed the political community, fostered notions of power, embraced racial views and participated in reshaping a divided country. This agency helped shape the new South, wherein planter power gave way to northern industrial hegemony. The South was reconfigured as the formerly enslaved African-descended population was elevated to semi-citizenship. Fitting the African Americans into a space and place was a clever bit of social engineering helping to stabilize the region.

Equally important, the fund, an early philanthropy, demonstrated the unlimited possibilities for private money to shape public policy. With the blessing of its financiers, a business foundation could enact or eliminate projects without any democratic deliberations. They could in fact become quasi-lawmaking bodies. Today's foundations possess enormous power as individuals move easily between jobs in large philanthropies and the government bureaucracy.

Finally, the Slater Fund, alongside other major philanthropies, mostly excluded African American voices. With few exceptions, neither African American agents nor African Americans were invited to help shape policy for African American education.

SLAVE NARRATIVES

Slave narratives form a literary genre comprised of autobiographical and biographical accounts about enslavement, written or narrated by fugitive or formerly enslaved persons. The largest body of slave narratives originated from enslaved Africans who were forcibly removed from Africa and transported to Europe, the Americas, and the Caribbean

during the transatlantic slave trade. There are more than 6,000 slave narratives and more than 200 books that illuminate their life histories during the 18th and 19th centuries.

During the 1930s, the Works Progress Administration (WPA) Federal Writer's Project gathered personal oral narratives from 2,500 formerly enslaved Africans. Among former nations that enslaved people, the largest corpus of slave narratives is in the United States. Slave narratives date as early as the 1700s and as late as the 1940s; however, related genres include captivity narratives of contemporary enslavement and neoslave narratives, in which authors, including Margaret Walker, William Styron, Toni Morrison, and Octavia E. Butler, have written from the perspective of enslaved Africans.

Reviewing the Literature

Included in the genre of slave narratives are texts ranging from letters and pamphlets to full-length books. Testimonies about life during enslavement are also found in abolitionist newspapers, diaries, legal records, and church records. Also, related to the genre of slave narratives are recent initiatives by the Slave Route Project of United Nations Educational, Scientific and Cultural Organization (UNESCO) to document oral narratives about the history of the participation of West African countries, namely Nigeria, Ghana, and Benin, in the trade of enslaved people. This entry attends to major themes and implications of slave narratives in North America, the Caribbean, and the United Kingdom.

Slave narratives have been widely studied by scholars of history and literature and are understood as critical to illuminating everyday lived experiences of enslavement. While most disciplines focus on macrolevel analyses of enslavement, slave narratives portray intimate reflections of lived experiences, identity, and self under the institution of enslavement. Slave narratives are also widely understood as foundational to the genres of autobiography and fiction in the United States.

During enslavement, most of the U.S. South posed brutal and legal consequences for enslaved Africans caught reading and writing or for anyone who may have taught them. Some enslaved Africans acquired skills in reading and writing and began to document their personal experiences, and in doing

so acted as agents in the formation of their own self-identity and authority. These testimonies as acts of social and political resistance inspired the literary tradition of the slave narrative. Given the history of subjugation and domination of African-descended populations by Europeans in the United States, these narratives provide key insight into daily interactions between African Americans as subordinates and Whites as superordinates from enslavement through Emancipation. The earliest slave narratives written during the 1700s provide accounts of life and enslavement in Africa, the Middle Passage, arrival in Europe or the Americas, and experiences of religious conversion to Christianity. Examples of narratives written in this era include those authored by Olaudah Equiano and Venture Smith.

Slave narratives authored in the 1800s often described conditions of daily plantation life, including experiences related to labor, family, religion, punishment, and physical, psychological, and oral acts of individual and collective resistance in the quest for freedom, including learning to read and write. These narratives became instrumental in the abolitionist movement to challenge the racially hierarchical and oppressive system of enslavement. Authors from this critical era of slave narrative production include William Grimes, Mary Prince, Josiah Henson, Jacob Stroyer, Frederick Douglass, Nat Turner, Henry Bibb, William Wells Brown, Harriet Jacobs, Henry "Box" Brown, and Harriet Tubman. Antebellum and post-Emancipation slave narratives describe daily life under the institution of enslavement and after Emancipation, often in southern states, though some narratives provide accounts of flight to northern states and Canada. Examples of these narratives include those by Lucy Delaney, Louis Hughes, Fredrick Douglass, and Booker T. Washington.

Implications for African American Education

From elementary through graduate education, slave narratives provide a useful tool for teaching about individual and collective experiences during enslavement in many social scientific and humanities disciplines including literature, history, African American studies, sociology, anthropology, and family studies. By privileging the autographical voice, these personal testimonies add to the historical

record, a critical component of truth based upon lived experiences. These documents are also helpful for teaching students about geography, sex and gender issues, childhood, the economic and cultural influences on the trade of people and enslavement. Slave narratives provide documentation of the earliest record of activities and aspirations relative to education and detail the earliest personal, sociological, and cultural influences on literacy development in the United States. Slave narratives are a unique tool for teaching the craft of autobiography and the novel. In addition, the portraiture and visual records that accompany the written text of some slave narratives provide insight into representations of self, geography, and movement across space.

Classroom discussions, museum visits, field trips, reviews of historical documents and recordings are representative of pedagogical tools useful for including slave narratives in instruction. Since the 1990s, the applications of curriculum development incorporating slave narratives into educational processes have been greatly enhanced by advances in technology and increased availability of digitized online resources, resulting in wider access to major collections of slave narratives through national and university libraries. The Library of Congress's *Born in Slavery: Slave Narratives from the Federal Writers Project, 1936–1938*, contains more than 2,300 first-person accounts of enslavement and 500 black-and-white photographs. The availability and accessibility of digital and archival collections and other resources, including recordings, create opportunities to enhance instruction about this important period in U.S. and world history. Understanding generated through study of slave narratives may contribute to restorative justice and reconciliation efforts.

SOCIOECONOMIC STATUS (SES)

Socioeconomic status (SES) is a concept that is understood and utilized well beyond the scope of African American education; however, given the sociopolitical context of American history, SES has a unique and distinct relationship with the progress and position of African Americans in education. This entry describes and illustrates the connections between SES and African American education in four sections: defining and describing SES, the historical context of SES and African American education, the status of African American education and SES, and summary of SES and African American education.

Defining and Describing SES

SES is most often characterized as the hierarchical rank of an individual or family in a particular community or society. SES spreads across a continuum stratified by social and economic resources. The social indicators of SES negotiate status within society and include intangible characteristics such as educational attainment, occupational prestige, authority, group associations, place of residence, and community standing. Some primary economic indicators of SES are tangible assets and include money, wealth, home ownership, pension plans, and property ownership.

A measure of students' SES relies heavily—and oftentimes exclusively—on the SES of their parents. More specifically, students and their families are generally classified into high, middle, and low SES based on a standardized composite index score of their parents' education level, occupation, income, wealth, and collection of household items that hold value. The terms “high SES,” “middle SES,” and “low SES,” respectively, refer to the upper, middle two, and lower quartiles of the composite index score distribution. While occupation type has remained rather stable over time in measures of

SES, income has continually needed to adjust to control for annual increases of inflation each year.

Decades of research have shown SES to be consistently and significantly correlated with occupational attainment, health status, and social capital. The study of SES is most prominent in sociology, which broadly and most often examines relationships between social and economic class and educational inequality, health, residential segregation, and race. Furthermore, social science researchers in general have used SES as a construct to disaggregate inequalities across racial and ethnic groups.

The Historical Context of SES and African American Education

The earliest measures of SES in the United States were constructed in the 1940s and relied solely on community reputation—that is, the social standing of an individual or family as judged by other members of a particular community or society at large. Community reputation was used to delineate upper-, middle-, and lower-class levels. While three (or in many cases four) levels of SES exist, the boundaries among levels have been often determined arbitrarily. Consequently, there has been no widely accepted and utilized theoretical cutting point for each SES level.

Cecil North and Paul Hatt were among the first researchers to study occupational prestige among American citizens. The level of prestige across employment was determined by studying respondents' identification of approximately 100 different occupations. Since the mid- to late 1960s, the work of Otis Dudley Duncan and Peter Blau has been the most prominent and comprehensive scholarship on SES. Duncan and Blau's seminal work was based on quantitative analyses of the first national survey on social mobility in the United States. Their findings indicate that parents transmit their social standing to their children, especially in regard to educational status. Additional research has expanded this work to illustrate that such transmissions sustain gaps in educational outcomes between Whites and African Americans. Researchers have begun to use a variety of measures to determine SES. While there is no general consensus about the single most appropriate way to measure SES, researchers generally agree that multiple measures of SES more accurately depict

and predict the SES of individuals and families in the United States.

Given the historical context under which Blacks were brought to and subsequently treated in the United States, African Americans have scored significantly and consistently lower on socioeconomic index (SEI) measures than their White counterparts. Beginning in the 1600s, Africans were legally sold to North American colonies and purposefully denied access to educational tools and environments. This allowed slaveholders to continually exploit Blacks for hundreds of years. As such, from the early 1600s to the 1860s, African Americans were situated in the bottom quartile of SES and were largely uneducated.

From the 1860s to the 1960s, increases in African American SES occurred but were terribly slow given legalized segregation and unequal access to educational institutions and resources. The adverse social conditions faced by African Americans created opportunities for Whites to accumulate wealth much longer than Blacks. As a consequence, there has been a persistent wealth gap between Whites and Blacks in the United States. Since wealth is cumulative and passed down from generation to generation, the gap only continues to expand, making it nearly impossible for Black families to approach equal levels of wealth with Whites.

Eventually, legal cases (for example, *Brown v. Board of Education, Topeka, Kansas*, 1954) and social policies (for example, Civil Rights Act of 1964) created conditions and opportunities for Blacks to increase their social and economic status in American society, particularly through interventions that mandated equal access to education. In the 1960s, only a small proportion of African Americans obtained improved employment opportunities and increased access to quality education systems that placed them in middle or high SES. However, in general, the relationship between SES and African Americans in education was inextricably linked to one another with the majority of Blacks situated in the bottom-SES quartile.

In the 1970s, however, desegregation became widespread and a larger proportion of African Americans were afforded opportunities to attend higher-quality, better-resourced schools that were similar to those of their White peers. Notwithstanding improved educational conditions, increases in SES have perpetuated slowly across

family generations. As such, progress has been unsatisfactory given that large gaps in educational outcomes remain between African Americans and their White counterparts.

The Status of African American Education and SES

Table 1 provides data from the National Center for Education Statistics on the percentage of Black, White, Asian, and Hispanic high school seniors in each SES quartile. Between 1972 and 2004, African Americans have made the largest gains in the proportion of high school seniors situated in the highest-SES quartile, increasing from approximately 5% to 14%, respectively. Accordingly, African Americans have experienced the largest decrease in high school seniors in the lowest-SES quartile, dropping roughly 26% over the same period.

However, in 2004, African American high school seniors were more than 20% more likely to be situated in the lowest-SES quartile when compared to their White counterparts. In addition, White and Asian high school seniors were more than twice as likely as African Americans (31% respectively, compared to just 14%) to be situated in the highest-SES quartile that same year.

Early Childhood, Elementary, and Secondary Education

Low SES

While African Americans have experienced enormous SES growth over the past five decades, the historical context under which Blacks were enslaved and uneducated has had significant, long-standing effects on African American education. Consequently, Black families and their children are more likely to experience poverty, reside in low-income neighborhoods, and hold fewer postsecondary credentials than do White families and children. Furthermore, research has shown that the number of parents in a family household is closely related to indicators of SES, and Black youth are substantially less likely to live with both parents than their White counterparts. These household structures have adversely influenced African American education.

African American households disproportionately lack basic necessities. This imbalance requires

Black parents from low-SES situations to place top priority on housing, food, clothing, and health care, which places education training as a secondary priority. African American families with low SES often lack the financial, social, and educational supports that enable Black families from high-SES situations to help their children prepare for early childhood education. African American families from low-SES backgrounds also have inadequate or limited access to community resources that promote and support their children's development and school readiness. Furthermore, African American parents from low-SES backgrounds may have inadequate skills to engage their children in reading and writing activities. As a result, children from low-SES families are more likely to enter kindergarten with significantly less implicit knowledge of books than children from high-SES backgrounds. In general, children from families with low SES are at greater risk of entering kindergarten underprepared and experiencing school failure as compared to their peers from families with middle or high SES.

School choice is another variable that distinguishes the experiences and outcomes of African American students across SES quartiles. African American students from lower-SES backgrounds disproportionately reside in low-income districts and have less access to schools with good resources. Research has shown that African American students from low-SES backgrounds are more likely to be assigned to schools, as opposed to African American students from high-SES backgrounds where their parents are more likely to self-select their schools.

African American students placed in low-income schools with poor resources must generally learn in educational systems that employ unprepared teachers who have basic or minimal teaching credentials. Moreover, low-income school districts experience greater teacher turnover and offer less professional development opportunities for teachers to remain abreast of current knowledge related to teacher pedagogy. African American students from low-SES backgrounds typically must learn in larger class sizes, which may foster increased academic disengagement.

High SES

Conversely, parents who experience higher-SES situations are able to provide their children with

Table 1 Percentage of High School Seniors in Socioeconomic (SES) Quartiles, by Race/Ethnicity: 1972, 1980, 1992, and 2004

<i>Characteristics</i>	<i>Year</i>			
	<i>1972</i>	<i>1980</i>	<i>1992</i>	<i>2004</i>

Note: Detail may not sum to totals due to rounding.

— = Not available.

high-quality child care, books, and toys that promote learning at home. Moreover, parents from higher-SES backgrounds have increased access to information and resources concerning their children's health, as well as social, emotional, and cognitive development. Lastly, families with high-SES backgrounds often have more time, social networks, and familial support to seek out information to help their children prepare for school.

Given that African American students from middle- and high-SES backgrounds are better

equipped for school, they are more likely to perform well academically and attend schools with sound resources and qualified teachers. In general, the outcomes of African American students tend to be better than their lower-SES peers given the increased access to social and economic resources.

Causes

While the African American students from high-SES backgrounds tend to outperform their low-SES

peers, Whites and Asians outperform African Americans in most academic indicators, such as standardized testing measures in critical subject areas (for example, math, reading, writing, and science) even after controlling for SES. The differences in experiences and performance between Blacks and Whites are due to the social conditions that plague African Americans in education. The dimensions of SES—parental education, income, occupation, place of residence—cannot resolve the adverse experiences African American students encounter in educational settings. As schools have become integrated in many districts, particularly during the past four decades, institutionalized and systemic racism still plague African Americans in education across all SES groups. Other constructs, such as “acting White” and “stereotype threat” posit that the social conditions under which Blacks are educated perpetuates underperformance.

Cures

While many educational environments in both low- and high-SES school districts negatively impact African American education, research has illustrated that certain conditions foster effective schooling on the secondary level. In particular, regardless of SES background, culturally relevant pedagogy, high expectations, supportive school climate, and parental involvement and support have all shown to increase academic outcomes of African American students.

Postsecondary Education

Postsecondary education is valued highly by American society. As such, attaining a postsecondary degree is a primary classifier of SES. The receipt of a postsecondary degree generally comes with increased opportunities for income and job security.

SES has a strong influence on the value and ability to access and succeed in higher education. Students from higher-SES backgrounds attend postsecondary education at much higher rates than do their lower-SES peers. One of the primary barriers that prevent African Americans and other racial-ethnic groups from low-SES backgrounds from attending postsecondary education is the cost of college. The shift from grants to loans during the

past two decades has “priced out” many low- and middle-SES African Americans from applying and enrolling in higher education. In addition, SES strongly influences African American student perspectives on the value and attainability of higher education. The probability of students attending schools of higher education is more likely for students from higher-SES backgrounds.

African American students from low-SES backgrounds are more likely to attend public institutions, community colleges, and historically Black colleges and universities compared to their higher-SES peers. Many low-SES students are also the first in their immediate families to pursue postsecondary education. With less education and income, African American students from low-SES backgrounds have fewer institutional choices from which to select.

African Americans from low-SES backgrounds are much less likely to persist toward postsecondary degree completion once enrolled. Academic, social, and cultural barriers collectively influence African American college student attrition, especially those from low-SES backgrounds. Research has shown that African American students from low-SES backgrounds have less contact with faculty, study less, are less engaged in campus activities, work more, and have lower grades than do their high-SES peers. Last, African American college graduates from low-SES backgrounds are less likely to attend graduate school than are their high-SES counterparts.

In sum, SES plays a critical role in African American education—both historically and currently. Policies, programs, and practices that decrease inequities between African American students across all SES quartiles and, more broadly, across all races and ethnicities are needed to improve the experiences and outcomes of African American students at every stage in the educational pipeline. SES will continue to stand as a defining factor of access to and success in education for African Americans.

SOUTHERN ASSOCIATION OF COLLEGES AND SCHOOLS

The Southern Association of Colleges and Schools was founded three decades after the Civil War to provide consistent and higher academic standards among the most prominent White southern colleges and universities, where funding and educational quality had not recovered from the war. In the 1930s, Black colleges asked the association to visit and evaluate their programs and provide an approved list that would facilitate students' applications for graduate and professional schools. This separate evaluation continued until 1961,

when Black colleges were absorbed in the larger association. This entry provides an overview of the association and then looks more closely at its relationship with Black schools.

Historical Background

The March 26, 1895, minutes of the Vanderbilt University faculty indicate that the Civil War had left the South both economically disorganized and educationally unsatisfactory. Southern colleges, which had previously been exemplary, were decimated by the war. Despite the beginnings of an economic and human resources recovery process in the 1880s and early 1890s, the Vanderbilt faculty described the educational picture as “tragic, chaotic, and almost hopeless.”

Vanderbilt Chancellor James Hampton Kirkland, an outstanding educational leader, organized the first meeting of the Southern Association in Atlanta on November 6, 1895. He became the first secretary of the association and served in that capacity from 1895 to 1908. He considered membership by his colleagues to be not an honor but an obligation. The goal was to establish nonprescriptive principles that enjoyed unanimous consensus and were as few and as general as possible.

Kirkland is considered to be father, prophet, and founder of the Southern Association. The first president of the association was President George T. Winston of the University of North Carolina. The six charter institutions were Vanderbilt, the University of North Carolina, the University of the South, the University of Mississippi, Washington and Lee College, and Trinity College (now Duke University).

Article I of the association's constitution indicates that the purpose of the association is to maintain high standards by considering college admission requirements and quality curriculum of preparatory schools. Bylaw No. 6 states that for junior colleges to be admitted, college work must be a significant part of their curriculum. Following adoption of a constitution and bylaws, the first academic resolution was the belief that inclusion of 4 years of Latin and 2 years of Greek was in the best interest of public high schools.

In 1912, the association established a Commission on Secondary Schools, which had a threefold purpose: (1) organizing the southern schools,

(2) raising standards and establishing uniform entrance requirements, and (3) separating preparatory schools from colleges. The Commission on Higher Education was organized in 1917 with 55 initial members—5 from each of the 11 member states.

In 1931, the membership of the Association of Colleges and Secondary Schools of the Southern States voted to change its name to the Southern Association of Colleges and Secondary Schools.

Status of Black Colleges

College authorities observed that in 1895, higher education for southern White colleges was chaotic, as a consequence of economic decline following emancipation. They concluded that the situation for African Americans, having been emancipated just 30 years earlier, was even more chaotic. At the same time, association records acknowledged that because of generous contributions from churches and foundations, some African American schools were doing better financially than were their White peers. Dillard of New Orleans is mentioned specifically.

Atlanta and Nashville schools were also cited as being exemplary, including Spelman, Morehouse, and Morris Brown. In Birmingham, Parker High School was the “largest high school for African Americans in the world.” It had been built during the height of the Ku Klux Klan movement in spite of threats to the Birmingham Board of Education.

Leaders of the Association of Colleges and Secondary Schools of the Southern States had such “tremendous problems of their own that it did not occur to them to meddle in the affairs of their African American neighbors.”

Minutes of the commission’s 1920 report indicate that northern colleges had requested a list of the best African American schools, and the commission recommended that a supplementary list be prepared and published separately.

An Invitation to Evaluate

In 1928, President Thomas E. Jones of Fisk University approached the association as a representative of the Southern Association of African American Colleges to request leadership and experience of the association in formulating and implementing standards for African American schools. Jones made it clear that he

was not advocating that a joint meeting be held. The executive committee of the association extended their cordial cooperation. After a year’s delay, the association appointed a three-person team of members who were advocates of African American education to serve as a special committee on African American schools. The members represented the Meridian, Mississippi, School District; Emory University; and the North Carolina State Department of Education.

The 1930 proceedings indicated that the association approved \$35,000 for the inspection of African American schools. Arthur D. Wright of Dartmouth University, a William and Mary alumnus who previously had been supervisor of African American Rural Schools in Virginia, was appointed executive agent of the special committee.

In the summer of 1930, higher-education institutions for African Americans received letters explaining the committee’s purpose and inviting those who desired a review to request it. The response was overwhelming, as 60 of the 85 African American postsecondary schools requested reviews. Because the executive agent was unable to visit 60 institutions between September and December of 1930, an arbitrary list of 15 institutions was selected for review based on the view that they were most likely to meet the association standards.

The executive agent was able to visit nine institutions: Fisk University, Morehouse College, Johnson C. Smith University, Shaw University, Spelman College, Talladega College, Virginia State College, Virginia Union University, and Winston Salem Teacher’s College. Only Fisk was designated as a “Class A” institution, meaning it was in compliance with all association standards for higher-education institutions. The association set up a “Class B” category for six institutions that were in partial or noncompliance with one or more standards, but the overall quality of the institution warranted recognition as a baccalaureate degree-granting institution. These schools were Johnson C. Smith University, Morehouse College, Spelman College, Talladega College, Virginia State College, and Virginia Union University.

Table 1 shows the number of African American schools by class and by state that were approved by 1939. Association approval is significant because graduates of approved schools are generally considered for admission to graduate and professional schools.

Table I Number of Negro Schools by Class and by State That Were Approved by 1939

State	Class A 4-Yr Colleges	Class B 4-Yr Colleges	Class A Jr. Colleges	Class B Jr. Colleges	Secondary Schools
Alabama	2	1	1	2	6
Florida	1	0	1	1	5
Georgia	5	3	0	0	13
Kentucky	2	0	0	0	13
Louisiana	3	0	0	0	4
Mississippi	0	2	0	1	4
North Carolina	6	4	1	0	22
South Carolina	1	1	0	1	6
Tennessee	2	2	0	0	4
Texas	3	3	0	0	15
Virginia	3	0	1	0	14
Totals	28	16	4	5	106

Annual meetings of the association were suspended from 1942 to 1945 because of World War II, but the executive committee continued to meet; and it approved the establishment of a Committee on African American Schools. In 1961, the separate listing of approved African American colleges was discontinued, and the 67 qualified African American colleges were absorbed into the association's general membership list.

SOUTHERN UNIVERSITY

Southern University, one of the largest historically Black universities in the United States, began admitting students in 1880. The university has played a major role in the education of African Americans. Today, its graduates live across the United States; many of them are leaders in their fields and have made significant contributions to the uplift of African Americans. From schools of law, education, nursing, engineering, science and mathematics, medicine, theology, and technology to its record in athletics, Southern University has built an institution that has served African Americans well.

Now a system with campuses in Baton Rouge, Shreveport, and New Orleans, the university offers 86 baccalaureate programs, 23 associate degree programs, 26 master's programs, 1 postmaster's program, and 5 doctoral programs. Although its New Orleans campus was destroyed in Hurricane Katrina, Southern University is poised to be one of the leading

universities in the state of Louisiana, the nation, and the world. This entry looks at its history and then briefly summarizes the university's present outlook.

Southern University and A & M College (SUBR), the Baton-Rouge-based flagship campus of the Southern University system, produces more African American nurses than any other institution of higher education in the United States. SUBR is number five in the production of African American engineers in the United States. The campus also boasts being number five in the production of African American baccalaureates who go on to earn a PhD.

University Leadership

Southern University was initially conceived in 1879, when P. B. S. Pinchback, T. T. Allain, and Henry Demas proposed the establishment of a school that would serve people of "color." It was first located in New Orleans, Louisiana, with 12 students and an operating budget of \$10,000. The former Israel Sinai Temple Synagogue was one of the original locations of the newly established campus in New Orleans. The university was relocated to Baton Rouge, Louisiana, in 1914. The Baton Rouge campus provided the university with the much-needed land to continue its growth.

Father and Son

Dr. Joseph Samuel Clark served as the first president of the campus in Baton Rouge. Clark was active in the Louisiana colored teachers association as well as other organizations concerned with the education of African Americans. During Clark's tenure as president, the university's enrollment grew from 47 students to 500. When he retired in 1938, his son, Dr. Felton Grandison Clark, assumed the role of president.

During Dr. Felton Clark's administration, the university underwent major changes in both enrollment and campus infrastructure. The campus enrollment grew from 500 students to nearly 10,000 students. In addition to this, numerous campus buildings were erected on the growing campus. The climate of racial injustice and the unwillingness of Louisiana State University's law school to admit African American students resulted in a special Louisiana Convention that allowed the

university to establish a law school in 1947. The university later founded campuses in New Orleans and Shreveport. The additional campuses were incorporated into the university system in 1974. The Southern University system is the only historically Black university to have its own system and governing body. Dr. Felton Clark retired from the university in 1969. His successor was Dr. Leon G. Netterville.

The Activist Era

Dr. Netterville's administration was highlighted by the student activism of the tumultuous 1960s, when African Americans united to tackle inequality. In 1972, students gathered to protest on campus and were confronted by law enforcement. Two students were shot, but the murders of Denver Smith and Leonard Brown have remained unsolved. The 1960s and 1970s saw the growth of a campus that was the hub of African American intellectualism and activism that affected the state of Louisiana.

Lawyers from Southern University were prominent activists in filing lawsuits to challenge unjust laws. Marion White and Charles Bryant, two lawyers in St. Landry Parish, vehemently fought to end racial injustice in a parish considered to be one of the most hostile for African Americans in the state. Southern University had an impact on the education of African Americans in the state of Louisiana. Its College of Education produced some of the finest teachers in the nation. A large majority of its teachers were socially conscious and vocal critics of injustice.

The graduates of Southern University's teacher education programs were equipped with the intellectual skills and activism needed to uplift African American students. Contrary to common belief that African American schools were inferior, Southern University's College of Education produced graduates who were highly committed to social justice and the education of African American students. The impact of Southern University teachers could be seen in nearly every African American community in Louisiana. The College of Education has continued to be a leader in graduating African American teachers in the state of Louisiana. In the preparation of future teachers, Southern University Laboratory School serves students from prekindergarten to 12th grade.

Current Situation

After settling the consent decree (a court order between the U.S. Department of Justice and the State of Louisiana concerning desegregation), the university experienced changes to both the physical campus and academic programs. The university constructed 13 major facilities, which included the J. S. Clark administration building, John B. Cade Library, Mayberry Dining Hall, the Health Research Wing, Performing Arts building, Nursing School building, and several other campus facilities.

The university has recently celebrated the settlement of a \$60 million bond project designed to bring significant changes to the campus. The changes will include construction of new buildings, renovation of existing buildings, and infrastructure improvements throughout the SU System. One of the most anticipated projects includes a 75,000-square-foot intramural facility. The intramural facility will house an aerobics studio, weight and training spaces, a natatorium, and basketball and volleyball spaces.

One of the major challenges facing the Southern University System, which comprises Southern University at the New Orleans campus (SUNO), Southern University at Shreveport, Southern University Agricultural Research and Extension Center, Southern University Law Center, and Southern University and Agricultural and Mechanical College, is the rebuilding of its New Orleans campus, which was completely destroyed by Hurricane Katrina.

SPECIAL EDUCATION

Special education has been described as the provision of specialized instructional strategies and supports designed to meet the educational needs of students with disabilities. Since the passage of the Education of All Handicapped Children's Act in 1975, states have been required to provide free, appropriate, public education to all students with disabilities. This law was reauthorized in 1997 as the Individuals with Disabilities Education Act (IDEA). However, despite a number of reauthorizations since its inception, the central provisions of the original law remain intact. These include provisions such as individualized education plans (IEPs), education in the least restrictive environment, appropriate assessments for eligibility determination, parental consent for assessment and placement in special education, and due process for disagreements between parents and districts with respect to the provision of special education services. This entry looks at the impact of special education on African American students.

Historical Perspective

Special education has played a complex role in the education of African American students. This complexity is reflected in court cases such as *Larry P. v. Riles*, a 1970s class action lawsuit filed in California that alleged that the use of standardized intelligence tests in the placement of African American students in special education was inappropriate. The court found that these instruments did have a discriminatory impact on African American students, causing them to be greatly overrepresented in classes for what at the time was called the "educable mentally retarded."

The issue of disproportionate representation of African American students in special education became a dominant theme in the field during the

late 1960s and early 1970s. In Lloyd Dunn's seminal essay, "Special Education for the Mildly Retarded: Is Much of It Justifiable?" the author not only pointed out the existing disproportionate representation of minority students in programs for the mentally retarded; he also questioned the efficacy of such programs, arguing that they unnecessarily separated students with disabilities from their nondisabled peers and provided inferior educational programs to students with disabilities. Such critiques of the role of special education in the education of African American students were common during that time.

Some of the provisions of the Education of All Handicapped Children's Act were designed to address these issues. For example, nondiscriminatory assessment is required in determining eligibility for special education. Further, the law mandates that decisions regarding special education eligibility cannot be made based solely on the results of one assessment. For example, in the case of mental retardation, intelligence test scores cannot be the sole basis for placement. Other tools, such as assessments of adaptive behavior, also must be used. This mandate is designed to avoid mislabeling any student as retarded who may score below average on an intelligence test but may otherwise function normally.

The Education of All Handicapped Children's Act also addressed the issue of "least restrictive environment." This gave rise to the term *mainstreaming*, which commonly referred to attempts to educate students with disabilities with their nondisabled peers to the maximum extent possible while still meeting the educational needs of all students. The concept of mainstreaming has its roots in civil rights legislation that overturned the "separate-but-equal" concept. Court cases such as the 1954 *Brown v. Board of Education* case provided the legal foundation by which the practice of separating students based solely on disability status could be challenged.

Current Issues and Trends

The field of special education continues to face a number of challenging issues and trends in the education of African American students with disabilities. These issues and trends include factors that emanate from within special education itself as well as those that are born of influences

within general education, and from within society as a whole. Some of these issues and trends are highlighted next.

Disproportionate Representation

Despite increased attention and safeguards built into law, the disproportionate representation of African American students in special education persists, along with trends that suggest that these students are segregated from their nondisabled peers at a higher rate than students with disabilities of other races. For example, the *27th Annual Report to Congress on the Implementation of IDEA* in 2005 revealed that African American students are 1.5 times more likely than their peers to be identified as disabled. This disproportionate representation is particularly striking in the category of mental retardation, in which African Americans are 3 times more likely to be represented than is the case for their peers. In the category of emotional disturbance, African American students are 2.3 times more likely to be represented.

The stigmatization associated with the labeling process is one reason that disproportionate representation is a significant issue in the education of African American students. Labels such as "mentally retarded" and "emotionally disturbed" have an inherently negative connotation. Such labels can encourage educators to lower expectations for students so labeled, which in turn can cause educators to provide educational experiences to these students that do not take full advantage of their capabilities. This practice can lead to the self-fulfilling prophecy, or the idea that educators create or exacerbate learning problems by treating students as though they cannot achieve at high levels.

A number of factors have been said to contribute to the disproportionate representation of African Americans in special education. Poverty is one such factor. According to the U.S. Department of Education's report, *Status and Trends in the Education of Racial and Ethnic Minorities*, 15.7% of all families with children under 18 live in poverty. This figure stands at 30.1% for similarly disposed African American families. Poverty has been associated with a number of factors known to have a deleterious effect on child development and consequently on educational outcomes. These factors include increased childhood exposure to lead,

increased prenatal exposure to toxins such as tobacco and alcohol, lack of prenatal care, and poor nutrition.

Higher poverty rates among African Americans, however, cannot completely explain the extent of their disproportionate representation in special education. Other variables related to systemic bias also are believed to be contributing factors. Classroom observational studies have suggested that teachers tend to have more positive interaction with White students (for example, praising, calling on) than is the case for African American students. Negative attitudes toward African American students can predispose them to be referred for special education evaluation.

Once the evaluation process has been initiated, it generally assumes a within-child defect and does not critically examine elements of the educational environment that may have contributed to the concerns that initiated the referral. Instruments used in the evaluation process, such as intelligence tests, also have been criticized for cultural bias. All of these factors converge to increase the complexity of the disproportionate representation of African American students in special education. This has made the overrepresentation particularly resistant to change.

Inclusion

The concept of including students with disabilities in general education classes has been a dominant theme in the field for more than 40 years. In the 1970s, as mentioned this concept was known as “mainstreaming.” By the late 1980s, it had evolved into the concept of “inclusion,” which focused on integrating not only students with and without disabilities but also on integrating the systems of general and special education in a more seamless way. This involved using resources in both general and special education to make general education classrooms more receptive to a broader array of student learning diversity. It was no longer the expectation that disabled students would be educated in separate settings unless they could meet the demands of a typical classroom. Rather, typical classrooms were expected to change in order to better embrace student learning diversity.

While there has been a steady increase in the percentage of students with disabilities who spend the majority of their school day in general education

settings, African American students with disabilities have lagged behind their peers in this regard. According to the *27th Annual Report to Congress on the Implementation of IDEA*, African American students with disabilities were more likely than any other racial-ethnic group to be educated outside of the general education classroom. Only 38.6% of African American students with disabilities were educated in general education settings for at least 80% of the school day. This figure stood at 49.9% for all students with disabilities and 54.7% for White students.

The disproportionate segregation of African American students with disabilities in separate special education settings can have harmful effects for several reasons. Since part of what students learn is through interaction with peers, restricting their access to general education settings limits their opportunities to learn typical academic and social behaviors that are modeled by their nondisabled peers. Additionally, research has suggested that grouping students homogeneously by ability depresses the academic achievement of students assigned to low-ability groups. This is related to the self-fulfilling prophecy and calls into question the efficacy of separate special education placements.

The Teaching Force

The preparation teachers receive to work with students from diverse backgrounds can affect issues such as the disproportionate representation of African Americans in special education. Without adequate preparation, teachers can mistake cultural differences for disabilities and are unable to appropriately address cultural differences in instruction. Although the need to better prepare teachers for cultural diversity has been widely recognized, this area has been found to be weak, both in terms of pre-service and in-service teacher education.

The presence of African Americans in the teaching force also is critical with regard to this overrepresentation of African Americans in special education. According to a report from the Center on Personnel Studies in Special Education, African American teachers make up 10% of the special education teaching force, which is slightly less than the 12% that African Americans constitute in the general population. The gap widens, however, in the representation of African Americans in the

teaching force at 10% and their representation in special education at 20%. In some instances, this gap is particularly striking. For example, while African American males are greatly overrepresented in special education as students, they are severely underrepresented in special education as teachers.

It has been estimated that African American males make up only 0.4% of elementary special education teachers and 2.2% of secondary special education teachers. The presence of African American teachers in general education also has an impact on special education. For example, research has shown that as the percentage of minority teachers in a school district increases, the percentage of minority students placed in special education classes decreases.

An adequate supply of special education teachers of any ethnicity has been shown to be an additional challenge in the high-poverty, high-minority school districts in which most African American students reside. According to the *23rd Annual Report to Congress on the Implementation of IDEA*, large school districts, such as the high-poverty, high-minority school districts that serve many urban areas, are more likely than their smaller counterparts to cite lack of qualified applicants as a significant barrier to filling special education positions. As a result, students with disabilities in high-poverty areas are significantly more likely to be served by special education teachers who are not fully certified. All of these factors can have an impact on the education of African American students with disabilities.

Future Directions

Despite these complex issues, progress is being made. A number of mechanisms have been put in place to address the issue of disproportionate representation of African American students in special education. For example, states are required to report not only numbers of students served by race-ethnicity in each disability category, but also the extent to which these students are served in general education settings. Additionally, with the reauthorization of IDEA in 2004, local education agencies are required to set aside funds to address the overrepresentation of minority students in special education through early intervening services designed to prevent inappropriate referrals to special education. Measures such as these help to

focus the attention of educators on the issue of disproportionate representation and help to encourage these educators to take the steps necessary to adequately address this concern.

Another promising trend is the increased emphasis on preparing both general and special education teachers to better meet the educational needs of African American students. The tenets of culturally responsive instruction and differentiated instruction are being integrated into both pre-service and in-service teacher education to a greater extent than has been the case in the past. This can have an impact for several reasons. First, they can help prevent inappropriate referrals for special education services. If teachers are aware of culturally influenced learning or behavioral differences, they will be less likely to mistake these differences for disabilities. Second, if teachers have the pedagogical skills to appropriately address culturally influenced learning or behavioral differences, these differences will be less likely to result in the kind of academic problems for which students are often referred to special education. Third, even in the instances in which African American students may have real, intrinsic disabilities, if all teachers are able to use pedagogy that accommodates a broad array of learning differences, more of these students can be appropriately served in general education classrooms, making the practice of placing them in separate settings unnecessary. This would help address the disproportionate representation of African American students with disabilities in the more segregated special education settings.

Although these promising trends have not been in place long enough to assess their full impact, there is reason to believe that positive outcomes will follow. With reforms occurring within both general and special education, there is a greater chance that significant progress will be made.

SPELMAN COLLEGE

Spelman College is a private, historically Black women's college in Atlanta, Georgia, that is now part of the Atlanta University Center Consortium. Spelman currently has about 2,151 full-time students from 44 states and 15 countries. It is listed as the top historically Black institution by *U.S. World & News Report*, which also includes it among the top 100 liberal arts colleges in the United States. The college has the highest graduation rate among historically Black institutions and surpasses the graduation rate for African American students at a number of predominantly white high-ranking public and private institutions.

Spelman has played a key role in training African American women for leadership and

preparing them for graduate study. From 1997 to 2006, 150 students earned doctoral degrees in science and engineering, second only to Howard University. Spelman also gained international recognition in 2005 when its “SpelBots” robotics team became the first all-female and African American undergraduate team to compete in a global robotics competition in Japan.

Founded as Atlanta Baptist Female Seminary by two New England women, Sophia B. Packard and Harriet E. Giles, the school opened in 1881 in the basement of Friendship Baptist Church in Atlanta. It was established not only to teach formerly enslaved women and girls to read, write, and do simple arithmetic but also to prepare them to serve as teachers, missionaries, and church workers. Practical skills were stressed as part of preparing students to be good homemakers and mothers.

In 1882, after hearing a presentation by Packard and Giles at Wilson Avenue Church in Cleveland, Ohio, one of the church members, John D. Rockefeller, became a lifelong contributor to both the school and African American education in general. With additional support from the American Baptist Home Mission Society and its women's auxiliary, nine acres of land and five buildings—former Union Army barracks—were purchased. The financial support of Mr. and Mrs. John D. Rockefeller Sr., together with other gifts ranging from \$1.00 to \$1,000, made it possible to complete payment of the mortgage.

The school moved to its new location in February 1883, and Packard and Giles fought a proposal to merge the female seminary with the Atlanta Baptist Seminary (now Morehouse College), a school for African American males. Packard and Giles believed that their female students would be better served by keeping the schools separate. To do so, they had to raise enough money to support separate schools, and they received money from Baptists in the North and African American Baptists in Georgia. The Rockefellers donated the remaining amount, and in 1884, the school's name was changed to Spelman Seminary, in honor of Laura Spelman Rockefeller and her parents.

The curriculum expanded to include college preparatory classes equivalent to high school. A nurse training department opened in 1886, followed

in 1891 by the missionary training department. A new building was dedicated in 1918 to house the expanded home economics program. Spelman Seminary established the College Department in 1897, although most of the college work was at nearby Morehouse College.

One of the most significant events in Spelman's history occurred in 1924, when it changed from a seminary to a full-fledged college intended to provide a liberal arts education to its students. Under the leadership of Florence Matilda Read, who served as president from 1927 to 1953, the curriculum was expanded, with college courses established in the humanities, fine arts, social sciences, and natural sciences.

Albert E. Manley, the first African American and first male president, succeeded Read in 1953, ending nearly a half century of White female New England leadership. During his tenure from 1953 to 1976, Spelman strengthened its liberal arts program with the addition of non-Western and ethnic studies courses. Several other new programs were implemented in the 1970s, including Freshman Orientation and Freshman Studies, the Health Careers Program, the Family Planning Program, and cooperative programs with predominantly white majority institutions.

During the 1960s, Spelman women were active in the civil rights movement. Marion Wright (Edelman), Roslyn Pope, Hershelle Sullivan (Challenor), Ruby Doris Smith (Robinson), Bernice Johnson (Reagon), and Alice Walker were among the student leaders of protests that included sit-ins in downtown Atlanta and protests across the South. Harry Lefever, Professor Emeritus of Sociology at Spelman, documents their participation in his 2005 book, *Undaunted by the Fight: Spelman College and the Civil Rights Movement, 1957–1967*. Howard Zinn, author of *A People's History of the United States* and a member of the Spelman history faculty from 1956 to 1963, played an active role in mentoring and supporting student activists.

When Manley announced his retirement, many faculty and students assumed that in this time of new opportunities for women, the next Spelman president would be a Black woman. Student protests followed the appointment of an African American man, Donald Mitchell Stewart, but Stewart assumed the presidency in 1976. During his 10-year tenure, several new programs were established, including

the Honors Program, the Comprehensive Writing Program, the Continued Education Program, and the Women's Studies Program.

The Women's Research and Resource Center, the first women's research center at a historically Black institution, was established in 1981 under the leadership of Beverly Guy-Sheftall, founding director and Anna Julia Cooper Professor of Women's Studies. The center subsequently played a leadership role in the development of a women's studies minor and an interdisciplinary major in comparative women's studies. In addition to partnering with other departments to offer courses exploring issues of gender and race, the center sponsors a variety of national and international conferences and continues to support Black feminist scholarship and activism. In 2004, the Center joined with SisterLove, Inc., to organize a global conference on HIV/AIDS among girls and women in Africa and the African Diaspora. Most recently, the center undertook a 3-year project funded by the Ford Foundation that explored and strengthened links among women's studies scholars, departments, and programs in Africa and the African Diaspora. The Spelman Archives, a component of the WRRC, include the papers of Audre Lorde, Selma Burke, Toni Cade Bambara, and Johnnetta Cole.

In 1987, Johnnetta Betsch Cole became the African American woman to serve as Spelman's president. Under her leadership, Spelman achieved national status as one of the leading liberal arts colleges in the United States. She presided over a campaign that raised \$114 million, the largest amount that had been raised by a Black college or university. The endowment was tripled, rising from \$42 million to \$143 million. During Cole's tenure, Drs. William and Camille Cosby gave Spelman College a \$20 million gift to construct the Camille Olivia Hanks Cosby Academic Center. This gift, the largest from an African American to a historically Black college, also established the William and Camille Cosby Endowed Professorship Program, which supports professorships in the fine arts, humanities, and the social sciences. After leaving Spelman in 1998, Cole joined the Emory University faculty as the Presidential Distinguished Scholar at Emory University, where she is now professor emerita. Cole served as president of historically Black Bennett College for Women in Greensboro, North Carolina, from 2002 to 2007.

The first laboratory school at a historically Black college was the Spelman Nursery-Kindergarten School, which became part of the college's resources in 1930. Renamed in 1997 as the Marion Wright Edelman Child Development Center, it offers nursery through kindergarten programs for children ages 2½ through 6 years and serves as a training center for parents, a practice field for college students, and a research laboratory for graduate students in education and psychology.

In 1998, Audrey Forbes Manley, a Spelman graduate and widow of Albert Manley, became the first alumna to serve as president of Spelman. The first African American to be appointed assistant U.S. surgeon general, Audrey Manley also served as acting surgeon general of the United States prior to her appointment to the Spelman presidency. When her late husband had served as president of Spelman, she had played a key role in the establishment of the Spelman Health Careers Program in 1971. Under her leadership and presidency, Spelman continued to strengthen its position as a leader in educating women in the sciences. Today, about one quarter of Spelman students major in science, engineering, or math. According to American Medical Association data for 2001, Spelman ranked second only to Xavier University, a historically Black institution in New Orleans, in the number of graduates who attend medical school. Xavier sent 94 students to medical school, followed by Spelman, with 38, and Harvard University, with 37.

Beverly Daniel Tatum succeeded Audrey Manley in 2002, becoming the ninth president of Spelman. Under her leadership, Spelman has established several new "centers of distinction." Among them is the Center for Leadership and Civic Engagement (LEADS), formed in 2003. A year later, LEADS sponsored its first national leadership conference. Its goals include student, faculty, and staff development as well as community outreach. It offers training to prepare students for leadership roles and provides public programs that bring together women leaders from around the world. In 2008, LEADS launched the Spelman College Intergenerational Leadership Mentoring Program, which provides students with mentors from a number of fields, including law, business, medicine, architecture, acting, and community leadership. Sisters Center for WISDOM (Women in

Spiritual Discernment of Ministry) was also launched in 2004. Through a variety of programs that include training, scholarships, and internships, it gives students an opportunity to explore spirituality and vocation and their relationship to advocacy and leaderships. Other centers at Spelman focus on behavioral neuroscience, biomedical and behavioral research, energy and environmental studies, and molecular biology.

The college continues to offer a wide range of innovative programs, including the Summer Art Colony in Portobelo, Panama, which gives students an opportunity to live, work, and study in the Caribbean; the Japan Studies Program, which includes an exchange program and an intensive 4-year summer program in Japan; and the Spelman Independent Scholars Oral History Project, which pairs students with mentors from the community in a two-semester interdisciplinary and intergenerational program. Spelman also offers a 5-year dual-degree program through which students can earn at bachelor's of engineering from one of 12 participating schools, including Georgia Institute of Technology, the University of Michigan, and Rensselaer Polytechnic Institute.

STANDARDIZED TESTING

During the 20th century, educational and political leaders asserted that standardized tests—for example, the Scholastic Aptitude Test (SAT) that is often a criterion for college entrance—would broaden opportunities for African Americans, but the history of testing provides limited support for this claim. Standardized tests were not created to exclude African Americans, and, especially in the South, where most African Americans were formally educated during the 20th century, they were adopted in response to African American demands for equality. Unlike the crude constraints and customs they replaced, standardized tests did not restrict the access of advantaged African Americans, heirs of the African American elite, but they remain durable obstacles for most African Americans. Growing reliance on tests has produced paradoxical and problematic patterns of inclusion, widening opportunities for advantaged African Americans without addressing the isolation of most African Americans.

The most significant test of testing is the extent to which it has improved the life chances of African Americans, and the record indicates that tests in the professions, colleges and universities, and the public schools have had differential effects on African Americans. As activism forced authorities to eliminate crude forms of discrimination, officials erected more subtle barriers, the most legally defensible of which relied on standardized tests. Tests did not restrict access for all African Americans, and enforcement of the Civil Rights Act of 1964, affirmative action, and the desegregation of schools, colleges, and universities increased the size of the African American middle class. Yet as opportunities and outcomes improved for advantaged African Americans, testing did little to improve the life chances of most African Americans. These paradoxical outcomes suggest that far more than tests will be required to leave no African American child behind.

Teacher Testing

During the 20th century, teaching was the principal African American profession. Since the 1930s, advocates of teacher testing have argued that these

instruments would provide an objective basis for determining the qualifications of educators and improve the caliber of teachers, but teacher tests have done as much to perpetuate discrimination as to raise the stature of the profession.

The forerunner of the Praxis tests, which are used in most states today, the National Teacher Examinations (NTE) were created by Ben D. Wood and first administered to 4,000 prospective teachers in March 1940. By forcing school boards to eliminate separate and unequal salary schedules, National Association of Colored People (NAACP) litigation led to increased use of the exams in the South, where the vast majority of African Americans are taught. While critics charged that the NTE did not provide evidence of teaching ability, the examinations appealed to southern school officials because they saw in them ostensibly objective evidence to support their belief that African American teachers were inferior to their White counterparts.

White and African American teachers were judged against the same standard, but African Americans had access to vastly unequal educational opportunities and had for decades been paid salaries that were one half of those of Whites. Although most African Americans, handicapped by these disadvantages, earned NTE scores below those of almost all Whites, advantaged African Americans, most of whom were graduates of private schools and colleges earned scores that exceeded those of many Whites.

As schools were forced to desegregate, officials turned to teacher tests to limit the presence of African American teachers. Following the *Brown* (1954) decision, the Educational Testing Service (ETS), which assumed control of the NTE in 1948, aggressively marketed the exams. During the 1960s and 1970s, the NTE was widely used to dismiss and demote African American teachers. In many cases, officials established cutoff or passing scores arbitrarily and failed to show that tests distinguished those who performed well in the classroom from those who did not.

The NTE was not the only reason that fewer African Americans entered or remained in the teaching profession, but growing use of these exams contributed to a reduction in the percentage of African American teachers from 12% of all teachers in 1970 to less than 7% by 1986. During this period, African Americans who performed well on

these tests were more likely to come from families with higher incomes than were African Americans who did not perform well. Prospective teachers are now required to pass tests in most states, but there is scant evidence that test scores predict performance in the classroom. As a result, teacher testing remains the source of controversy and litigation.

University Admissions

Well into the 20th century, African Americans were excluded from most universities, creating cumulative disadvantages that are substantial and enduring. Most southern states did not provide graduate and professional programs for African Americans until the 1940s, and only token numbers of African Americans were enrolled in most northern universities. As a result, African Americans had access to fewer doctors, bankers, lawyers, and professors who prepared African American professionals. By 1943, only 128 African Americans held doctoral degrees.

Poverty and inadequate educational facilities prevented most African Americans from advancing, but improvements in African American incomes and the GI Bill helped 11,000 African Americans graduate by 1947, more than 10 times as many as in 1927. As increasing numbers of African Americans graduated from college and demanded access to universities and the professions, educational and political leaders adopted standardized tests. These tests were not created to exclude, but they were certainly used to restrict African American access to the professions, colleges, and universities. These instruments did not prevent advantaged African Americans from gaining access, but as with the NTE, the institutionalization of standardized tests structured patterns of access based on class as well as race.

After World War II, a generation of African American college graduates sought admission to southern universities, challenging barriers that had long blocked African American access to the professions. Early efforts focused on legal education and led authorities to adopt standardized tests to limit African American access to the practice of law. After Virgil Hawkins applied to the University of Florida law school in 1949, officials began requiring that applicants submit standardized test scores. In other southern states, political leaders established new requirements to the practice of

law as African American students began graduating from separate African American law schools.

Until the late 1940s, graduates of state-supported law schools in many southern and some northern states held a diploma privilege that guaranteed their admission to the state bar. In South Carolina, for example, this privilege was revoked in 1950, and for the first time, prospective lawyers were required to pass an examination before they could practice law. In Delaware, Alabama, Mississippi, Georgia, as well as Ohio and California, bar examinations allowed small numbers of advantaged African Americans to gain access at the same time that they created durable obstacles for most African Americans. By 1974, in California, there was one White lawyer for every 450 Whites, but one African American lawyer for every 3,000 African Americans.

Growing reliance on standardized tests limited the number of African American professionals to token levels, and it was not until the late 20th century that advantaged African Americans realized significant gains. By 1960, only 1.2% of lawyers were African American. Little change occurred during the 1960s, but political and affirmative action produced increases in the numbers of mostly advantaged African Americans who enrolled in law school and practiced law. By 1990, 3.5% of lawyers were African American, and by 1997, the number of African American attorneys had risen to 111,700.

As African Americans pressed for admission to public colleges, southern authorities extended policies first adopted in graduate and professional education to the college level, and began requiring—for the first time—that undergraduate applicants submit standardized test scores. New barriers to higher education allowed small numbers of advantaged African Americans to gain access to prestigious institutions without ending the exclusion of most African Americans. Less than 5% of the nation's college applicants took the Scholastic Aptitude Test in the early 1950s, but use of the SAT rose during the decade.

After African Americans applied to the University of Georgia, officials began requiring that as of April 8, 1953, all applicants to state colleges “take appropriate intelligence and aptitude tests.” South Carolina established a new admissions policy that required all applicants to submit standardized test

scores less than two weeks after *Brown*. After James Meredith's court-ordered admission to the University of Mississippi in 1962, applicant's tests scores became the sole criterion for admission to traditionally White universities in the state. This requirement was adopted, the court found, to exclude African Americans and minimize desegregation.

These new practices could only limit access; they could not deny it completely. In higher education, more rational restrictions, the most durable of which relied on standardized tests, shaped patterns of segregation that were increasingly based on class. As new forms of class segregation took hold, advantaged African Americans gained admission to the most prestigious colleges and universities. Still, as with professional education, the most significant African American progress in higher education did not occur until the late 20th century as a rising tide of protest, pressure from the courts, and enforcement of the Civil Rights Act of 1964 and affirmative action combined to push the presence of African American students beyond the most token levels.

As advantaged African Americans led enrollment into prestigious institutions, disadvantaged African Americans became more isolated in colleges and universities that became segregated by class as well as race. African American college enrollment more than tripled between 1970 and 1996, rising from 5% of total enrollment in 1965 to 12% by 1990. By 2000, however, more than 3 times as many Whites as African Americans were college graduates.

Elementary and High School Testing

As the courts gradually forced public schools to desegregate, the use of testing and tracking intensified, exploiting African American social and economic disadvantages. By 1960, growing numbers of school districts in the South had established tracking systems. Tracking separated students by race and class and produced little upward mobility. Beginning in 1956, students in Washington, D.C., were assigned to college prep, regular, general, or basic programs on the basis of test scores.

Research showed that class as well as race shaped access. In one senior high school where median income was \$10,374, 92.2% of the students were assigned to the top tracks. At another,

where median family income was \$3,872, only 15.2% of the students were assigned to the top tracks. Proponents of tracking claimed that it would fuel mobility, but by 1963, 96.9% of junior high students in Washington were still in the track they had occupied two years earlier. When African American activists challenged the tracking system, the court found that there was minimal fluidity between the tracks. By the 1980s, a comprehensive study of more than 174 school districts reported that Whites were 3.2 times more likely than African Americans to be enrolled in gifted classes. African Americans also remain significantly underrepresented in advanced placement courses, in part because they remain segregated in schools that did not offer such courses.

Led by southern states, during the 1970s and 1980s, educational authorities adopted minimum competency tests. Between 1971 and 1988, widespread desegregation, improvements in African American incomes, and rising levels of parental educational attainment narrowed the Black-White gap in reading scores on the National Assessment of Educational Progress (NAEP) by 21 points, the equivalent of two grade levels. Progress stalled in the 1990s. This lack of progress casts doubt on the claims made by those who argue that minimum competency tests by themselves have narrowed achievement gaps. In most states, testing regimes were not fully implemented until the late 1980s and early 1990s, when the Black-White achievement gap began to widen. A recent review of the literature finds little evidence that testing has reduced the achievement gap.

By 1996, 18 states required that students pass a standardized test to earn a diploma. There is a good deal of evidence that these exams have done as much to limit high school completion as improve achievement. African Americans remain considerably more likely to be retained, pushed out of school, and fail graduation tests than Whites. In Florida, for example, 19.2% of African Americans were denied a diploma in 2003 compared to 5.2% of Whites. As with other tests, African American students from families with higher incomes and higher levels of parental educational attainment are more likely to pass these tests than are their less advantaged African American peers. Because of persistent racial differences in socioeconomic status, by 2001, only 50% of African Americans

graduated from high school, compared with nearly 75% of White students.

STUDENT NONVIOLENT COORDINATING COMMITTEE (SNCC)

The Student Nonviolent Coordinating Committee (SNCC) played a critical role in the Black liberation movement during the civil rights/Black Power era. One of the many legacies of the organization was the freedom schools developed in Mississippi during Freedom Summer. The freedom schools were an alternative to the inadequate and inferior education provided to African American children in the Mississippi public school system. The education initiative led by SNCC also provided a blueprint for the development of education institutions and for education reforms regarding African Americans.

This entry provides an overview of SNCC's history and examines its position on education.

Founding a Movement

On February 1, 1960, nearly 6 years after the U.S. Supreme Court overturned *Plessy v. Ferguson* (1869) and ruled in favor of the plaintiffs in *Brown v. Board of Education of Topeka, Kansas* (1954)—one of the most important decisions in the history of African American education—four African American students who attended North Carolina Agriculture and Technical College initiated one of the largest direct action protest movements in the United States. The student-led sit-in at Greensboro's downtown Woolworth lunch counter was the impetus that inspired other students throughout the country to challenge the status quo and the Jim Crow laws that gripped the country.

Students grew tired of the slow and patient practices of the leadership of the established civil rights organizations, such as the National Association for the Advancement of Colored People (NAACP) and the Southern Christian Leadership Conference (SCLC). The student sit-in movement was a watershed moment and a radical approach to achieving freedom.

While students subscribed to direct action philosophy and strategy, many civil rights leaders, including Dr. Martin Luther King Jr., who was referred to as “da Lawd,” embraced the idea of the establishment of a student organization. Ella Baker, executive director of SCLC and longtime community activist, also recognized that the students needed to create an organization; however, she believed that student organization should be autonomous from the veteran civil rights institutions.

During the Easter weekend, April 16 to 18, 1960, Baker summoned student activists from across the country to participate in a leadership development conference at Shaw University. Baker organized the conference in Raleigh to help coordinate the various efforts initiated by students and to encourage the protesters to broaden their agendas beyond sit-ins and fight all forms of segregation. She also insisted that primarily African American students staff the new organization and that it develop its leadership from within; she thought it should avoid a charismatic leader. By the close of the weekend conference, attendees announced the formation of a new

civil rights organization, the Student Nonviolent Coordinating Committee (SNCC).

Taking Action

After establishing itself as independent civil rights organization, SNCC continued to challenge the inequities in the U.S. social system. A contingent of full-time student organizers, also known as field secretaries, traveled to Rock Hill, South Carolina, to join the student-led boycotts and sit-ins that sparked the “Jail No Bail” campaign. Serving jail time instead of posting bail was another tactic that differentiated SNCC from the traditional civil rights organizations.

Known for their involvement in sit-in movements at lunch counters in southern communities, members of SNCC also participated in 1961 Freedom Rides organized by the Congress of Racial Equality (CORE). The freedom rides were a campaign for which African American and White freedom riders challenged the segregated restrooms, restaurants, and waiting rooms at interstate bus facilities below the Mason-Dixon line.

While some students continued the rides for freedom, some of the SNCC field secretaries concentrated their efforts to organize African American voter registration campaigns in rural counties of Alabama, Georgia, and Mississippi. In collaboration with the Council of Federated Organizations (COFO), SNCC field secretaries in Mississippi helped to organize Freedom Vote. About 80,000 African American Mississippians participated in the mock election that confirmed their desire to participate in the political process from which they had historically been excluded. As a result of the overwhelming African American voter turnout, the Mississippi Freedom Democratic Party (MFDP) was established to challenge the Democratic party at the National Democratic Convention.

Education Agenda

The education system for African Americans in the Magnolia State was repressive and perpetuated the status quo. African American children were expected to be satisfied with their inferior status in the social order in Mississippi.

During the fall of 1963, while many SNCC field secretaries participated in the planning of Freedom

Summer, former Howard University student and a SNCC field secretary, Charles Cobb Jr. conceived the idea of the freedom school program, which addressed the inadequacies in the Mississippi public school system. Cobb believed that education was political. He wanted to provide African American students a broad intellectual and academic experience, something they did not receive from the Mississippi public education system.

Making a Plan

The freedom schools were designed to encourage the students to ask questions and hope that the racist society in which they live could improve. Freedom schools were also viewed as a political organizing tool that produced students able to work for social change. They showed African American Mississippi children a world outside their impoverished classrooms and taught them things about themselves and their history that Mississippi's school never dared to teach.

The original target population for the freedom schools was 10th and 11th grade students; however, when the doors opened students from age 3 to 23 attended the 2-month supplemental education program. Freedom school coordinators anticipated serving 1,000 students; surprisingly, well over 2,000 attend freedom schools across the state. To help address the massive enrollment numbers, community centers were opened across the state in areas where freedom schools were established. The community centers provided educational services for preschool children, mothers with children, as well as the elderly. Community centers also addressed issues beyond the capacity of the freedom schools.

New Teachers and Teaching Style

SNCC's freedom schools ideologically contrasted the Mississippi public school system as well as the education it provided African American children in the state. The teachers in the Mississippi education system were considered an extension of the oppressive state. Teachers were described as timid, punitive, dictatorial, hostile, and even vengeful, especially toward African American children. Unlike the teachers employed by the State of Mississippi, a majority of the volunteer teachers in the freedom schools were noncertified White college students

and recent graduates from colleges and universities from northern and west coast campuses. Many were naïve and inexperienced with Mississippi politics or Jim Crow laws in the South. Even though the freedom school instructors were deficient in their teaching and knowledge of the African American experience in Mississippi, most of the volunteers were youthful, highly idealistic, enthusiastic, and dedicated to securing civil and human rights for all people.

The teachers in the freedom schools did not follow the traditional classroom rules; instead, they implemented innovative teaching methodologies. Rather than have students sit in conventional rows, which was done in the traditional Mississippi classroom setting, freedom school teachers sat in circles with the students so that equality could be stressed. This seating arrangement also fostered free expression.

In addition to the unorthodox seating arrangements, the instructors moderated discussions instead of lecturing to the students. Freedom school instructors engaged students in role-playing activities to simulate some of the issues students faced or would possibly endure in the future. Students were also encouraged to be skeptical, challenge and question information provided to them. Because Cobb understood that education was political; the heart of the freedom school was the citizenship curriculum. Noel Day created the curriculum and instructional materials for the Mississippi freedom schools based on his book, *Curriculum Guide for Freedom Schools*. Citizenship curriculum was to assist in the growth of self-respect, through self-awareness, that led to self-help and local leadership development.

A Student Proclamation

In an effort to unify African American high school students across the state, the Mississippi Student Union (MSU) was created. The MSU and freedom school coordinators organized a statewide convention August 8 to 9, 1964, which coincided with the Mississippi Freedom Democratic Party convention. Meridian was selected for the conference location because the three-story Baptist seminary that housed the freedom school could accommodate the 100 student delegates expected from across the state. Meridian was also selected because it was the site where James Cheney,

Andrew Goodman, and Michael Schwerner had been murdered for attempting to establish a freedom school in Neshoba County.

At the close of the convention, students created a proclamation that addressed issues such as public accommodations, housing, health, foreign affairs, federal aid, job discrimination, the plantation system, civil liberties, law enforcement, city maintenance, voting, direct action, and education. According to the proclamation that students issued to state officials, the students made the following demands regarding education:

1. Better facilities in all schools, including textbooks, laboratories, air-conditioning, heating, recreation, and lunchrooms
2. A broader curriculum, including vocational subjects and foreign languages
3. Low-fee adult classes, as preparation for better jobs
4. A school year consisting of 9 consecutive months
5. Exchange programs and public kindergartens
6. Better-qualified teachers
7. Forced retirement (women at 62 and men at 65)
8. Special schools for mentally retarded and treatment and care of cerebral palsy victims
9. A ban on using taxpayers' money to fund private schools
10. Integration and equity at all schools throughout the country
11. Academic freedom for teachers and students
12. Support for teachers to join any political organization to fight for civil rights without the fear of being fired
13. Elimination of teacher brutality

The demands by the students who attended freedom schools in Mississippi can be linked to the movement to improve African American education in the United States.

A Turn to Black Power

In 1966, Stokely Carmichael (Kwame Ture) was elected a chairman of SNCC. During this same

period, the ideological and philosophical position of the organization also changed. Many members of the organization touted Black power and believed SNCC needed to close ranks. Carmichael suggested that White SNCC workers help organize poor Whites and help humanize those who held racist opinions.

This was the beginning of a general turn to Black separatism. In a position paper published by a group of SNCC's member in the Atlanta Project, it was suggested that true liberation could not happen until SNCC cut ties with Whites, establish Black-owned and operated institutions, and write history from an African American perspective.

Many of the students who participated in the freedom rides and other activities sponsored by SNCC were involved in the development of the Black Student Union Movement on college and university campuses across the country. More students were attending college than in previous years. This was partly because of the passage of the Higher Education Act (HEA) of 1965, which was part of President Lyndon Johnson's "War on Poverty." HEA was designed to provide opportunities for lower- and middle-income families, program assistance for small and less-developed colleges, additional and improved library resources at higher-education institutions, and utilization of college and university resources to help deal with national problems like poverty and community development.

Universities also modified admission requirements and developed special programs to attract students from urban environments. Since many African American students educated in the public school system were not prepared for college, universities made remedial classes available for those who came from schools that had not adequately prepared them for college. With the influx of African American students on campus, militant students began to make demands. As part of the political consciousness, students changed the names of student organizations. Negro Student Associations was changed to Black Student Associations and Black Student Unions.

Students confronted university officials to help address some of the issues faced by African American students. To deal with the social isolation and alienation of the campus and to make campuses more hospitable for African Americans, students demanded cultural centers and dormitories or at least designated floors on existing dorms. Also,

African American studies as a discipline prepared African American students to return to their communities to give back and help solve some of the pressing issues. African American Studies units at colleges and universities also bridged the gap between the African Americans on campus and African Americans in the community.

Community Control

SNCC's impact can also be traced to the community control movement in African American education. Those who participated or witnessed SNCC activities were active in the lives of their children who attended public schools. Parents demanded the schools provide curriculum relevant to the lives of African American children. In New York City, Ocean Hill-Brownsville parents and community members sought control of Junior High School 271 in the late 1960s. In 1969, African American residents of Hyde County, North Carolina, resisted an integration education plan and engaged in a shootout with the Ku Klux Klan in order to maintain control of the schools in their community. While some parents engaged in efforts to control the public schools in their communities, other parents organized to create independent Black institutions in the 1960s.

SNCC's influence can also be seen in the development of the independent Black institution (IBI) movement. Many of the founders of the IBI movement were involved with the development African American studies movements or graduates of African American studies programs. In addition to independent schools and supplemental education programs, SNCC also contributed to the development of alternative education and tutorial programs in African American communities.

The freedom schools initiated by SNCC had an impact not only on the education of African Americans in Mississippi in the mid-1960s; the idea and initiative has also made a major contribution to the education of African Americans throughout the United States.

SUBSTANCE ABUSE

Substance abuse is a challenging social issue and presents problems for students of all ethnic and socioeconomic backgrounds. Substance abuse can present a dilemma for African American students from personal, social, and economic standpoints. Although African Americans are less likely to engage in gateway drugs and other illegal substances than are their White and Hispanic counterparts, as John M. Wallace (1999) found, when African American youth begin engaging in illegal substances they are likely to exhibit sustained use. In addition, African Americans appear to be at greater risk for HIV/AIDS as a result of intravenous drug use than other populations, according to the Lawrence S. Brown and Arthur I. Alterman study (1992).

This has specific implications for programs directed toward African American preadolescents and adolescents. With a disproportionate number of African American youth residing in impoverished communities, they are likely to be exposed to the open use of drugs and to be targeted by drug marketing campaigns. In addition, African Americans within poor communities are exposed to a stereotypical image of African American drug dealers.

With a disproportionate number of African American youth residing in poor, inner-city communities, national programs sponsored by such agencies as the Center for Substance Abuse Prevention have funded programs targeting these at-risk populations including culturally competent models such as African-centered approaches. Such programs have aimed at uplifting the self-esteem and life trajectory of African American youth. Faye

Z. Belgrave and others have designed and evaluated programs focused on African American youth, particularly African American females. These researchers have discovered gender-specific patterns of higher drug use among African American males as well as a greater tolerance for drug use by African American males than by African American females.

The subculture of drug trafficking, sometimes underscored through rap lyrics, contributes to an atmosphere grounded in drug use. The glamour of the life of a drug dealer is emboldened in some rap music. Consequently, some students are likely to form an attraction and minimize the consequences of both drug use and trafficking. Even for African American youth from middle- to upper-class communities, the subculture of drug trafficking is intriguing and represents a bold attitude toward society. The relative impact of rap music on the decision making of African American youth has not been systematically assessed; however, anecdotal evidence suggests that African American male youth are at risk for enticement into the drug-trafficking culture.

As to alcohol, many urban African American youth are bombarded with images of happy youth enjoying 40 ounces of malt liquor. Alcohol distribution companies target these youth through trendy advertisements in various media outlets within the African American community. Advertisements in popular magazines that target African American youth associate success and prosperity with alcohol use. Stores within African American communities are more likely to promote malt liquor.

Although smoking becomes more problematic for African American youth in their adult years, the marketing world promotes cigarette products such as "Black and Mild." These products are distributed with various attractive flavors and are associated with the hip hop culture. These cigarette products are associated with drug paraphernalia and are promoted for use with other illicit drugs.

Of the gateway drugs, marijuana presents a critical challenge to African Americans. African American youth are more likely to use marijuana than are their White counterparts. Although African American youth are less likely to engage in substance use at earlier ages and tend to use substances on the collegiate level at a lower level than their White counterparts, they are more inclined to use marijuana at a higher level than do their White counterparts.

Within the movie industry, casual use of marijuana is promoted in motion pictures. Movie icon Chris Tucker's drug use in *Friday* typifies desensitization to the apparent risks of marijuana use. Moreover, professional athletes of African American descent sometimes appear in the headlines for marijuana use. African American females are sexualized in films as well as music videos as seductive associates with drug-trafficking males. In addition, African American females are at increased risk for associating with males who are drug traffickers, and the term *mule* has become associated with females who assist males in the transportation of drugs. There have been national cases involving African American female college students who have received extreme mandatory sentences for their involvement in drug trafficking. Just as their male counterparts, African American females who engage in drug trafficking are more likely to receive harsher sentences than are their White counterparts.

In higher education, students attending smaller historically Black colleges and universities (HBCUs) are less likely to engage in alcohol and drug use than their White counterparts at typically larger institutions, according to a 1996 study by Presley, Meilman, and Cashin. Subcultural environments fostered through Greek letter organizations enhance the likelihood that African American students will engage in alcohol and drug experimentation, the researchers found in later studies.

Within African American youth populations, there is a continued need for effective prevention and intervention programs to address drug experimentation and use. African American youth are more likely to be incarcerated for drug possession with a likelihood of intent to resell than to receive treatment for drug consumption. African American youth drug experimentation is more likely to be criminalized rather than addressed through educational and therapeutic models.

Within public schools in particular, national programs such as Drug Abuse Resistance Education (D.A.R.E.) have demonstrated limited effectiveness; students are asked to overcome their apprehension of police and begin to view the police trainers as educators. These models target youth who are likely to attend school on a regular basis, whereas students with inconsistent attendance who are at risk for school dropout and at greater risk for high-risk behaviors such as drug

experimentation are least likely to participate in these school-based programs.

African American youth are less likely than their White counterparts to receive treatment for their drug use. Instead, they are more likely to be punished for this behavior. Within the health care system, African American adults who seek medical assistance are more likely to be stereotyped as drug seeking as opposed to having legitimate physical pain necessitating drug treatment.

SWANN V. CHARLOTTE-MECKLENBURG BOARD OF EDUCATION

In the wake of *Brown v. Board of Education*, *Topeka, Kansas* (1954), Whites began to move away from the centers of larger metropolitan areas to erect de facto White-only school systems in adjacent suburban and rural areas. Thus, the phenomenon of “White flight.” In *Swann v. Charlotte-Mecklenburg Board of Education* (1971), the U.S. Supreme Court asserted that the pairing of noncontiguous school zones was a permissible remedy for school segregation. In so doing, the Court affirmed desegregation remedies that addressed metropolitan areas as a whole. This entry addresses the backstory,

the facts and the implications of *Swann v. Charlotte-Mecklenburg Board of Education*.

Historical Context

The Supreme Court in *Brown v. Board of Education* declared, “Separate is inherently unequal,” following up in 1955 with the directive that schools should desegregate with “all deliberate speed” (p. 301). The phrase “all deliberate speed” was interpreted in ways that led to delaying tactics to thwart desegregation efforts. In the *Southern Manifesto*, 19 senators and 77 representatives from 11 states officially expressed their defiance of *Brown*. The manifesto declared *Brown* unconstitutional, commended state actions resisting desegregation, and called for *Brown*’s reversal. Accordingly, state legislation inhibiting public school desegregation was passed, while local school boards enacted policies to frustrate desegregation efforts, the most popular of which were pupil assignment and freedom of choice plans.

North Carolina’s resistance to *Brown* was moderate compared to other states. In *Brown*’s wake, the Governor’s Special Advisory Committee on Education was assembled and delivered a report on December 30, 1954. With the guiding principles of “preservation of public education in North Carolina” and “preservation of the peace throughout North Carolina,” the committee recommended against compulsory desegregation: “The Committee is of the opinion that the mixing of the races forthwith in the public schools throughout the state cannot be accomplished and should not be attempted.”

Additionally, the committee recommended state relegation of enrollment and pupil assignment to local control. This strategy’s effect was to spread state liability for noncompliance with *Brown* to local jurisdictions. The North Carolina General Assembly enacted this provision of the committee’s report in 1955, along with an action conveying title to the state’s buses to local governments.

With these state structures in place, little desegregation occurred in local school districts. Civil rights activists met these new obstacles with more litigation. However, in a series of cases including but not limited to *Cooper v. Aaron* (Arkansas, 1958), *Green v. County School Board* (Virginia, 1968), and *Alexander v. Holmes County Board of Education* (Mississippi, 1969), the Supreme Court made it clear that compliance with desegregation mandates

was demanded. Reinforcing the Court, Congress passed the Civil Rights Act of 1964 in an effort to give general guidance in desegregation efforts as well as penalties for failure to comply with the law.

Facts of the Case

Swann v. Charlotte-Mecklenburg Board of Education was initiated in 1964 on behalf of 6-year-old James Swann and nine other African American families in the Charlotte-Mecklenburg area. The local geographic assignment plan as supplemented by student choice did allow for some desegregation, with 2,126 African American children attending 43 desegregated schools. However, as late as 1968, 99% of African American students attended 21 racially segregated schools.

The Swanns were represented by Julius Chambers of the NAACP Legal Defense Fund (LDF). They lost the initial suit, as the district court held that the Constitution did not require the active pursuit of desegregation. However, in light of the Supreme Court’s decisions in *Green* and *Alexander*, the suit was filed again. In 1969, Judge James B. McMillan ordered the Charlotte-Mecklenburg School District to desegregate.

Given the extent of residential segregation, and upon the recommendation of the appointed expert, Dr. John Finger, Judge McMillan found busing to be an effective strategy. The case was appealed to the Fourth Circuit, affirmed with respect to all but the elementary grades, and remanded for reconsideration of the latter. Upon remand, Judge McMillan reaffirmed his prior decision.

In response to litigation in *Charlotte-Mecklenburg*, the state of North Carolina passed an anti-busing law, which stated as follows:

No student shall be assigned or compelled to attend any school on account of race, creed, color or national origin, or for the purpose of creating a balance or ratio of race, religion or national origins. Involuntary bussing of students in contravention of this article is prohibited, and public funds shall not be used for any such bussing. (N. C. Gen. Stat. § 115–176.1 [Supp. 1969])

This statute was challenged and invalidated before a three-judge panel in North Carolina.

Upon certiorari, the case was divided at the Supreme Court into consideration of the local desegregation plan and the anti-busing law. In its final decision, in 1971, the Supreme Court granted districts wide latitude in creating policies to desegregate schools and ruled the anti-busing statute unconstitutional. Beyond obstruction of desegregation efforts, the Court found that “the statute exploits an apparently neutral form to control school assignment plans by directing that they be ‘color blind’; that requirement, against the background of segregation, would render illusory the promise of *Brown*.”

Impact of the Rulings

Swann was a hallmark victory for civil rights activists and was followed by significant desegregation strides. In the aftermath of *Swann*, southern jurisdictions could no longer hide behind the lines of White flight, and by the end of 1971, 44% of African American students attended majority-White schools. However, segregation still abounded at greater proportions in the northern and western regions of the country, with only 28% of African Americans attending majority-White schools. Over time it was learned that integration required not only the presence of African American students in majority White schools, but also an integrated faculty and staff with high expectations for all students as well as an integrated curriculum and equal access to resources. Desegregation alone was not a substitute for quality education delivered by caring educators.

In *Swann*’s wake, southerners were able to capitalize upon vulnerabilities of the North and West, and conservatives joined across regions within Republican Party lines to rein in desegregation efforts generally and busing efforts in particular. The anti-busing movement had support in the Nixon White House, as evinced by the president’s advocacy of the Student Transportation Moratorium Act. In 1972, the act passed in the House of Representatives but was filibustered by the Senate. An anti-busing amendment to the Constitution was attempted but failed in 1979.

Despite these failed legislative efforts, anti-busing sentiments raged nationally from Boston and New York in the North, to Florida in the South, North Carolina in the East, and Seattle in the West. The contemporary result is public hostility to affirmative

desegregation measures, judicial weariness with the desegregation process, and school resegregation. Moreover, the Supreme Court’s view of color-blind, racially neutral policies is under reevaluation.

T

TALENTED TENTH

The Negro race, like all races, is going to be saved by its exceptional men. The problem of education, then, among Negroes must first of all deal with the Talented Tenth; it is the problem of developing the Best of this race that they may guide the Mass away from the contamination and death of the Worst, in their own and other races.

—W. E. B. Du Bois

The term *Talented Tenth* was coined in 1896 by Henry L. Morehouse to describe a program of social, political, and economic uplift to guide newly emancipated African Americans at the beginning of the 20th century. Noted educator, activist, and social critic William Edward Burghardt Du Bois made this concept central to his vision of a progressive, highly educated, and socially conscious class of African American leaders. Du Bois envisioned the best-equipped tenth of the race as providing leadership to the less advantaged 90%. The discussion of African American leadership inherent to Du Bois's Talented Tenth was of national importance as African Americans struggled against the vestiges of enslavement and second-class citizen status during the Jim Crow era of the late 19th century to achieve full citizenship during the civil rights era of the mid-20th century. Du Bois considered the Talented Tenth the vanguard of African Americans, and throughout the course of his lengthy political,

scholarly, and literary career, Du Bois's clarion call for the creation of an informed class of leaders inspired by the legacy of Black self-determination garnered him recognition as a preeminent thinker on issues concerning race in the United States and abroad.

An Education for a Free People

At the dawn of the 20th century, the discussion of the best type of education for the development of an African American leadership class was a hotly debated topic. The end of the Civil War signaled the United States' evolution from an agrarian economy supported by enslaved people to an industrial free-labor system. These changes meant that from the northern industrialists to the southern planters, many of the nation's chief powerbrokers were concerned about what to do with the newly emancipated. Historians of the period refer to this issue as the "Negro problem."

Failure to properly address this problem of incorporating the previously enslaved Africans into the political economy of race and work in the United States could mean the undoing of the delicate new relationship between the agricultural South and the emergent industrial North. In contrast, solving this problem created the possibility for social stability and economic prosperity for 20th-century United States. Therefore, from Presidents Woodrow Wilson and Theodore Roosevelt to industrialists John D. Rockefeller and Julius Rosenwald, leading U.S. politicians, philanthropists, and entrepreneurs were intensely

concerned with how to incorporate roughly 4 million previously enslaved people into the rapidly evolving landscape of the United States. Decisions about expediently incorporating the previously enslaved people into the nation were further complicated by these same decision makers' desires to maintain racially prescribed social and economic roles while simultaneously stifling political and civic aspirations within the African American community.

Against this backdrop, discussions of universal education and ultimately the best type of education for the previously enslaved Africans evolved. In *Is Separate Unequal? Black Colleges and the Challenge to Desegregation*, political scientist Albert Samuels argues that throughout U.S. history, regardless of the challenge, the United States has tenaciously depended on the courts, science, and the educational system to provide answers to social problems. Samuels refers to these three areas as U.S. cultural deities flowing out of a faith in "the power of education, respect for the rule of law, and faith in science."

In accordance with Samuels's assertion, the nation looked to the educational system as a powerful means of socialization for the previously enslaved Africans. In *The Education of Blacks in the South 1865–1935*, historian James Anderson quotes one of the chief White architects of African American education, William H. Baldwin, as seeking an educational system that teaches African American youth to "work with their hands to have few wants, and to stay in their natural environments."

Inherent to this racially prescribed approach to education was a singular focus on industrial education for African Americans as opposed to a more broadly based liberal arts curriculum reminiscent of the curricula taught at the best colleges in the United States at the time. This industrially focused brand of education, formulated by Hampton Institute founder Samuel Chapman Armstrong and justly named the "Hampton-Tuskegee Idea," emphasized rudimentary literacy and mathematics skills exclusively for African Americans, leading to vocations like carpentry, blacksmithing, printing, homemaking, and cooking. Albert Samuels further described White southern sentiment about the best type of education for the previously enslaved Africans as a desire to ensure that

Blacks receive the right kind of education for the Negro—one that did not disturb the racial hierarchy of the South. . . . Lacking the intimate intellectual ability, blacks should not aspire to "higher education"; rather, they should be content with vocational training.

This turbulent period in U.S. history resulted in the evolution of education for African Americans into service of the twofold function of preparing the freed men and women to continue to serve as the nation's primary laborers while at the same time conceptualizing their emancipation as a progression from being property with market value to being second-class citizens—free yet barred from political involvement. The outcome of these discussions concerning the most suitable form of education for African Americans was essential to the character that African American leadership would develop in the future. An emphasis on political disenfranchisement and economic serfdom inherent to the Hampton-Tuskegee approach to African American education was in direct contrast with the type of education that Du Bois envisioned for the establishment of a Talented Tenth.

Black Voices on Education and Leadership

At the turn of the 20th century, uppermost-level policy development and implementation as well as financial and curricular decisions concerning African American education were being made without African American involvement. Despite this reality, one should not believe that the African American community was in any way disengaged on these issues. The White power structure—largely due to the work of Armstrong and other philanthropists, politicians, and industrialists—felt they had found the best type of educational system to achieve their objectives by exclusively advocating industrial education for African Americans. To most effectively achieve their aims, they also understood that they sorely needed an African American spokesperson to disseminate their ideas to the African American community. Educator, author, and first principal of Tuskegee Normal and Industrial Institute Booker T. Washington filled this void.

Washington's Views

Washington's ability to understand both northern and southern White racial sentiment and then translate them to the African American community afforded him extraordinary influence with each of these groups. In fact, historian William Watkins credits him and his Hampton-Tuskegee philanthropic community not only with shaping African American education but more significantly promoting the blueprint for race relations and racial progress that shaped the 20th century and beyond.

Washington's adeptness at functioning in this capacity was demonstrated in what arguably became the most influential public discussion of race in the United States in the late 19th century: his 1895 *Cast Down Your Buckets Where You Are* speech. This speech has historically been referred to as the "Atlanta Compromise." Through the compromise, Washington provided conciliation to the South and advocated that African Americans remain silent on issues of civil rights. Further, Washington argued that the relationship between African Americans and Whites should function as a delicate balance: "In all things purely social we can be as separate as the five fingers, and yet one as the hand in all things essential to mutual progress."

Where higher education was concerned, in the spirit of his mentor, Armstrong, Washington advocated the need for a strong program of industrial education for African Americans that established a gospel of work and money intended to help formerly enslaved Africans "pull themselves up by their bootstraps" out of poverty and provide the nation with a strong labor force. Through this agenda, African Americans would compromise their duly earned rights as full citizens and submit to the social, political, economic, and educational needs of a racially based market system in exchange for the opportunity to prove their overall value.

Despite the fact that Washington's message enjoyed mass appeal among Whites and African Americans in the U.S., as evident through the hundreds of schools and educators that advocated his ideas, there were those within the African American community who vehemently opposed Washington's position: individuals like *Boston Guardian* editor William Monroe Trotter, educator and activist Ida Wells-Barnett, and Bishop Henry M. Turner. They

and their supporters were part of a African American intelligentsia that promoted a progressive vision of education and advancement for the African American community more closely aligned with Du Bois's Talented Tenth.

Du Bois's View

As an active participant of the African American intelligentsia, Du Bois has historically been recognized as Washington's greatest critic, and it is no coincidence that Du Bois's first ruminations concerning the Talented Tenth took shape during the era that Washington was at the height of his influence. Because Du Bois considered Washington's exclusively vocationally trained, politically impotent, and economically disenfranchised vision of African American leadership as dangerous, he critiqued Washington's compromise on the grounds that it "deprived [African Americans] of political rights, made a servile caste, and allowed only the most meager chance for developing exceptional men."

Further, Du Bois believed that Washington's emphasis on instilling in the masses a labor-focused mentality was misguided and historically unfounded as a strategy for communal uplift. Du Bois asked, "Was there ever a nation on God's fair earth civilized from the bottom upward?" Consequently, Du Bois considered a liberally educated and politically active class of leaders as vital to the uplift of African Americans.

Whatever the secondary concerns of Du Bois, Washington, and the philanthropists, they were all concerned primarily with the training of African American teachers and leaders and the ideological persuasion of the class. For the exceptional persons to guide the race, Du Bois looked to colleges like Atlanta, Fisk, and Howard to produce egalitarian social critics, and Washington looked to industrial normal schools like Tuskegee to produce leaders who would endorse and advance the Hampton Idea.

Through their debates, Washington and Du Bois were engaging diametrically opposing sides of the same argument. Du Bois framed this question as, "What under the current circumstance, must a system of education do in order to raise the Negro as quickly as possible in the scale of civilization?" Washington's response to this question was founded in proving to the United States that African

Americans as a free and properly educated class could more efficiently provide the nation with the labor that it afforded during enslavement while not disturbing existing societal norms.

Du Bois, in contrast, argued that African Americans had an extraordinarily rich and distinct culture that should be marshaled to enrich all aspects of U.S. culture:

Not Africanizing America, for America has too much to teach the world and Africa. . . . [Nor would he] bleach his Negro soul in a flood of white Americanism, for he knows that Negro blood has a message for the world. He simply wishes to make it possible for a man to be both a Negro and an American.

In effect, Du Bois called for this inclusion to occur through a mutual appreciation of both cultures.

Civil and political rights, as well as educational opportunity, were essential to the vision supported by Du Bois. Du Bois believed formerly enslaved Africans were in dire need of the best education, whether industrial or liberal, and that the nation could provide to assist them in adjusting to their new status as free people. Therefore, Du Bois considered the Talented Tenth the realization of the best that African Americans can provide from within their community to uplift their community and ultimately be both “Negro and American.”

The Lasting Legacy of Du Bois’s Talented Tenth

The debate between Du Bois and Washington profoundly influenced Du Bois’s ideas concerning African American leadership. However, a narrow focus on Du Bois’s early writings and the ideological controversy between him and Washington veils Du Bois’s broader legacy concerning Black self-determination and subsequently the Talented Tenth. Perhaps Du Bois’s greatest legacy lies in the depth of his understanding regarding major social issues facing humanity in general and descendants of Africa in particular.

Describing Du Bois’s educational thoughts in a 2005 book, Watkins explains that “because of Du Bois’ intense concern with questions of race and class, his views on education are often overshadowed.” Du Bois’s thoughts concerning historically

Black educational institutions (the training ground of the Talented Tenth) and Black students were rooted in his activism and predate many concerns of the African American community today. His thoughts regarding the benefits of and the necessity for separate African American educational institutions and the eventual negative impact of desegregation is prophetic. His record gives substance to history’s recognition of him as a “pioneer” in the “Black radical tradition within the education dialogue.”

It is a sad irony that Du Bois is most often singularly remembered for his early writings, because he reflected upon and reformulated many of his early ideas later in life. In fact, Du Bois increasingly distanced himself from the liberal canon that espoused a stratified approach to racial uplift reflected in the creation of a Talented Tenth. These sentiments are of particular significance considering that it is in many of his later writings that the seeds of the African American radical tradition in education can be found. It is here that Du Bois speaks most powerfully to the educational problems of today, including an irrelevant curriculum, African Americans educator shortage, high dropout rate, and the tenuous existence of historically Black colleges.

It is important to note that Du Bois’s break from liberalism correlates with his becoming increasingly more critical and suspect that the United States would ever truly remedy its most pressing societal ills. This growingly more radical position was reflected in his becoming a proponent of institutional separatism at the communal, national, and international levels and his ever-increasing critique of both race- and class-based inequities inherent to U.S. culture. Consequently, the contrast between his early and then reformulated thoughts on leadership and communal uplift were evident.

For instance, while Du Bois’s early writings supported the creation of a Talented Tenth, after visits to China and Russia and extensive studies of the philosophies of Karl Marx and Friedrich Engels, he then argued that the creation of a bourgeois tenth of the race may be derisive and antithetical to true African American uplift. Also, in his early work, Du Bois wrote about and advocated a broader spectrum of ideas for inclusion of African Americans in mainstream U.S. culture. His writings and actions during this era reflected the spirit

of protest and political activism for which he has historically been recognized.

From his leading role in the founding of the National Association for the Advancement of Colored People (NAACP) to his role as the primary organizer of the Niagara Movement and the Pan-African Congress, Du Bois worked to develop the type of leadership that he envisioned through the Talented Tenth. However, his later writings reflected his discontentment with the U.S. progress concerning race and class. In fact, his self-imposed exile to Ghana and eventual relationship with the Communist Party shortly before his death demonstrated the depth of this disappointment with United States.

Reflecting on this disappointment, Du Bois wrote to a friend, "I cannot take anymore of this country's treatment. We leave for Ghana October 5th and I set no date for return. . . . Chin up, and fight on, but realize that American Negroes can't win." In a sense, the lasting legacy of Du Bois and his Talented Tenth is yet to be realized, and his more than 80 years of involvement on issues concerning African American leadership is still reflected in struggles for freedom and equality for groups within and outside U.S. borders.

TAPE V. HURLEY

In *Tape v. Hurley* (1885), a Chinese immigrant couple went to court after unsuccessfully seeking admission to San Francisco public schools for their daughter. The state courts ruled that the girl could not be excluded simply because she was Chinese, although the school board quickly responded by establishing separate schools for Chinese, as if this action would provide equal opportunity for them in a harbinger of *Plessy v. Ferguson* (1896). As a major civil rights case, *Tape* offered a successful strategy against the state for its policy violating state law and the U.S. Constitution when entrance to public schools were denied on the basis of race.

Historical Context

The Chinese immigration to the West Coast and specifically California is primarily identified with the transcontinental railroad. However, there were Chinese people in the United States in the early 1900s as part of the dynamic political, economic, and geographical changes taking place in China. The discovery of gold in California in 1848, the tensions around the Civil War surrounding emancipating the enslaved Africans in the former Confederate states, and the transcontinental railroad presented an impetus for Chinese people to migrate. In the 1870s, gold mining in Idaho, Montana, and Nevada also drew Chinese immigrants.

In 1862, after the South seceded from the Union and the Civil War had begun, Congress passed the first of several acts funding railroad construction. The completion of the transcontinental railroad required an eastward spoke from Sacramento through Nevada into Utah and a westward spoke from Omaha to Utah. The eastward line was built by

the Central Pacific Railroad, using Chinese laborers for its most of its 11,000 workers.

The 1860s was also a period of economic downturn. In the West, it spawned anti-Chinese tensions, riots, land seizures, and expulsions. Railroad construction ended in 1869 with many Chinese settling where they were after their jobs ended. Many Chinese went into mining, especially gold mining. But when their claims were voided under anti-Chinese laws in Montana and elsewhere Chinese workers were pushed into other jobs like cleaning, cooking, tailoring, and laundry service positions. Subsequently, when mines closed in California, creating more and more unemployed railroad workers, this phenomenon contributed to the 50,000 Chinese who migrated to the strong commercial and manufacturing city of San Francisco.

The economic downturn also spawned a major lobbying effort against Asians that culminated during an election cycle in which Congress passed the Chinese Exclusion Act of 1882, which prohibited Chinese naturalization and property ownership. It was renewed and/or modified every decade until its partial repeal in 1943, further affecting Asians by banning Chinese immigration (except children) and leasing property and eventually creating an Asiatic Barred Zone, impacting all Asians. Increasing numbers of Chinese moved further east, to New Jersey, Maryland, and Pennsylvania.

Still, Chinese consistently fought back against the anti-Asian sentiment and laws by protesting anti-Chinese violence, suing for compensation, and pushing Chinese representatives to challenge such anti-Chinese actions as jeopardizing China–U.S. diplomatic relations. They also litigated in opposition to laws that were anti-Asian and unconstitutional. Even though in 1868 the California legislature unlisted Chinese children as a group entitled to public education (Whites, African Americans, and Native Americans were listed), some who were not White were permitted to attend White schools where White parents did not object. In 1874, Chinese students were admitted to public school in Sacramento. In 1880, the legislature modified the education legislation to state that all children in California were entitled to state-funded public education.

Finally, in this case as in the *Gong Lum v. Rice* (1927) case, there was an underlying tension in

the Chinese legal fight for racial equality: it was vis-à-vis White America not initially in concert with others who faced discrimination. That is, the Tapes and their legal team sought to distance themselves from the African American community and their struggle for nonsegregated public education. When Chinese parents in San Francisco petitioned for their children to attend public schools the initial answer was an offer to place Chinese students in schools established for African American children. However, many Chinese were angered because they viewed this as an effort to classify them with African Americans as colored and instead demanded their own school, a demand which was ultimately granted.

Facts of the Case

Joseph Tape and Mary McGladery Tape were Americanized Christians who had been educated by Presbyterian missionaries and met after immigrating to California. They married in 1875 and in 1884 sought admission of their oldest of eventually four children, daughter Mamie Tape, to public primary school in San Francisco. She was refused admission. The San Francisco School Board quickly banned any Chinese child from any public school in the city. Again the Tape family unsuccessfully sought admission, and then the prosperous businessman who was also the interpreter for the Imperial Consulate of China in San Francisco applied to the Superior Court of the City and County of San Francisco for help.

The Tapes were first granted an alternative writ requiring admission or showing why not. On the pleadings submitted, a verbal decision was rendered by Judge Maguire on January 9, 1885. He stated that excluding Mamie Tape from free public education simply because she was Chinese was not a proper construction of California education law. Further, he stated that such a law would be a violation of the equal protection clause of the Fourteenth Amendment under the decision in *Ward v. Flood* (1874), which correlated an individual's rights intrastate as equal and uniform per their respective conditions.

The board appealed to the California Supreme Court, citing its newly adopted ban on Chinese admission as well as sanitary/disease contagion concerns. Tape's attorney, William F. Gibson, was the son of a famous Chinese missionary. He argued

for the new 1880 state law, construing education laws broadly, treating Chinese citizens at least as well as other international groups (many diplomatic offspring attended White public schools), the equal protection clause of the Fourteenth Amendment, the Burlingame Treaty of 1868, and California's progressive liberal spirit. The 1885 California Supreme Court decision affirmed Mamie Tape's admission to the public school citing only Section 1662 of the 1880 Political Code as allowing for no existing legal exclusion of Chinese children from public school.

Impact of the Ruling

The ruling was a legal victory for public education of Chinese in California, the only group at that time that was left out of state-funded education. Nonetheless, it was an empty victory since the ruling in Tape sanctioned separate schools as if they were equal to white schools. So this case was both reflective of the anti-Asian immigrant sentiment at that time and a forewarning of the public school hard line that would become the law of the land later. The Chinese like African Americans and Native Americans also would be burdened by the official "separate-but-equal" doctrine spawned by *Plessy v. Ferguson* (1869). The board successfully lobbied to amend the education law to legislate separate Chinese public schools. These lasted until 1947.

Mamie Tape and her brother attended the resultant Chinese Primary School, which opened April 13, 1885. When her youngest sister was ready to attend school in 1895, the Tape family moved to Berkeley, where schools were integrated, and they were able to purchase a home (unlike in San Francisco, where restrictive covenants only allowed Chinese to own property in Chinatown).

TENURE AND AFRICAN AMERICAN FACULTY

Throughout U.S. higher-education history, African American faculty members have experienced achievements and challenges related to tenure. Early African American faculty such as Solomon Carter Fuller (Boston University Medical School, 1919); Joseph R. Applegate (Massachusetts Institute of Technology, 1955); and Jay Saunders Redding (Brown University, 1949) earned full professor status during a tumultuous period in higher education. These scholars laid the academic path for future generations of African American faculty members.

Initially, African American faculty members were academic leaders in historically Black colleges and universities (HBCUs). Today, HBCUs and community colleges continue to employ the largest number of tenured African American faculty members in higher education. The 2005 *Digest of Education Statistics* found that African American faculty members who were full time with instructional or research duties represented approximately 5% of faculty in higher education. African American faculty are not represented in proportion to the increasingly diverse undergraduate student population. Given the dearth of African American faculty in higher education, administrators and faculty have made efforts to increase the

presence of these tenured faculty. This entry looks at the important contributions African American faculty can make, reviews some obstacles to their progress, and examines attempts to encourage their presence.

Faculty Contributions

Earning tenure, which ensures academic freedom and protection of the faculty position, is an important milestone for full-time faculty members. In particular, the plight of tenured African American faculty centers on their contribution to higher education, their experience in the tenure process, and institutional efforts to support and retain them.

It is important for institutions to recruit and retain African American faculty members because they make distinct contributions to higher education. These faculty members are more likely to infuse research addressing diversity issues into the curriculum. This expanded curriculum exposes students to different research perspectives and insights. African American faculty contribute to the retention and recruitment of African students into undergraduate and graduate programs. African American faculty members mentor these students and may influence their decision to pursue advanced degrees and careers in academia.

The increased presence of African American faculty may improve the institutional climate for faculty from underrepresented groups, students, and staff. This allows African American faculty in administrative positions to create and support policies that contribute to a diverse campus community. They can conduct research that affects the lives African Americans (medicine, social justice, and so on). Researchers such as W. E. B. Du Bois (African American issues), George Washington Carver (agriculture), Daniel Hale Williams (medicine), and Edward Alexander Bouchet (physics) have used the academy as a vehicle to conduct research that has helped to shape U.S. society. Yet many of these early pioneers faced formidable challenges in pursuing academic careers as tenured faculty members.

Current Challenges

Institutions have made strides to recruit and retain African American faculty members, yet the faculty

ranks are not diverse enough. African Americans make up less than 5% of the professoriate in the United States. This chasm may be attributed to factors such as talented African American graduate students seeking positions outside higher education, the unique institutional culture and climate, and the formidable barriers to tenure and promotion.

Even though the tenure process is often viewed as an objective assessment of a faculty member's work, African American faculty often experience challenges and barriers associated with the process. African American faculty members often confront several criticisms about their academic work. African American faculty across many disciplines report that research that examines issues related to underrepresented groups is not valued or openly accepted as scholarly work in the tenure review process. African American faculty members in tenure track positions have raised concerns about the lack of transparency in the tenure process. The tenure process is often mired in contradictions, unclear expectations, and unspoken values that define research quality. This uncertainty as to the rules of tenure may often contribute to added stress for these faculty members.

Other challenges and barriers African American faculty members face are related to the socialization of junior faculty members during the tenure and promotion process. They are often overburdened as the sole person to support African American students, representing a minority voice in committee meetings, while conducting academic research. Because of the limited number of African American colleagues, they often feel isolated. Although these challenges persist, African American faculty members have persevered and continue to make contributions to higher education as a whole. This, in part, is due to institutional initiatives designed to improve the presence of African Americans in academia.

Remedial Initiatives

Institutions have implemented initiatives related to the recruitment and retention of African American faculty in higher education. These initiatives are designed to infuse the pipeline with graduate students and African American faculty to actively participate in higher education. These efforts underscore the institutions' commitment

to improving the diversity of the faculty and student populations.

Institutional and national programs exist to encourage African American students to pursue faculty careers in higher education. These programs offer students a multitude of opportunities to engage with faculty, develop communities of support, and conduct academic research. They prepare students for academic careers, provide access to talented future scholars, and address increasing the number of African American faculty in higher education. However, recent legal challenges to affirmative action legislation have hindered the ability of these programs to improve the racial-ethnic diversity of faculty in higher education.

Institutions have made efforts to retain African American faculty throughout the tenure process by addressing how these faculty members are socialized into tenured academic positions. For example, faculty mentoring programs encourage African American faculty to develop personal and professional relationships that engage them in the institutional culture. Additionally, institutions are improving how they communicate the tenure criteria and process for junior faculty. This transparency allows African American faculty to improve their ability to proceed through the tenure process. These initiatives are designed to assist and guide the next generation of African American faculty through the tenure process. While early pioneers have created the path, higher education must embrace the next generation of African American scholars.

THURGOOD MARSHALL SCHOLARSHIP FUND

The Thurgood Marshall Scholarship Fund (TMSF), recently renamed the Thurgood Marshall College Fund (TMCF), was established in 1987. This organization, which serves public historically Black colleges and universities (HBCUs) and those who attend these institutions, was originally founded by Dr. N. Joyce Payne in 1985 as the National Black Education Fund. This entry looks at its history and accomplishments.

Historical Background

Dr. Payne enlisted the efforts of corporations, individuals, educators, and the Office for the Advancement of Public Black Colleges (OAPBC) of the National Association of State Universities and Land-Grant Colleges (NASULGC), to create the grassroots organization that would later be named after Justice Marshall. The goal of the National Black Education Fund “was to help college students who were already working to pull themselves up by their bootstraps, but did not have the financial resources to pay for their education” by providing merit-based scholarships to students at public HBCUs.

In late 1986, Dr. Payne and others met with Justice Marshall to ask his permission to name their organization after him. They believed that Marshall was the perfect namesake. He was educated at HBCUs: Lincoln University (Pennsylvania) and Howard University Law School. As a lawyer, Marshall argued a number of educational segregation cases that opened primary through graduate education, including the 1954 *Brown v. Board of Education, Topeka, Kansas*, case. Marshall further broke the color barrier, using his HBCU education, by being named the first Black solicitor general and associate justice of the U.S. Supreme Court. Marshall agreed to the use of his name, and the National Black Education Fund was renamed the Thurgood Marshall Scholarship Fund on December 9, 1986. The name change became official in 1987.

The new organization was small and used its first few years to build support. Using a grassroots

strategy. TMSF built commitments from additional corporations, foundations, and business leaders. By 1993, TMSF was providing merit-based scholarships for 4-year and graduate degrees to students attending 38 public HBCUs. In 2000, the Thurgood Marshall Scholarship Fund expanded its mission beyond merit-based scholarships and added programmatic and capacity-building support for member colleges and universities.

Today's Program and Accomplishments

The TMSF, today, now supports 47 four-year public HBCUs and 6 law schools and has awarded more than \$50 million in scholarships, capacity-building and programmatic support. More than 5,000 Thurgood Marshall Scholars, who receive between 33% and 100% of their total tuition costs through the scholarships, have graduated and are employed in the fields of science, technology, government, human service, business, and education. The organization reports that 98% of scholarship recipients obtain degrees, and 52% of those go beyond the bachelor's degree and attend graduate or professional schools.

The TMSF estimates that their programmatic support and capacity-building grants have benefited more than 228,000 students at the 47 member colleges and universities. Additionally, the scholarship fund has provided leadership training and career management to hundreds of students selected by their institutions' presidents in their annual leadership institute.

Hurricane Katrina Projects

On August 30, 2005, Hurricane Katrina devastated New Orleans and caused destruction to three HBCUs: Dillard University, Xavier University of New Orleans, and Southern University of Louisiana. Southern, the only public HBCU in New Orleans and a member of the Thurgood Marshall College Fund, was particularly affected. Southern, an open-admissions institution serving mostly nontraditional students, sits just south of Lake Pontchartrain and west of the Inner Harbor Navigation Canal that connects the lake to the Mississippi River. There were five levee breaches along the canal, causing \$350 million of damage to the university. Faced with vast damage and a meager endowment

of \$2 million, the institution had no choice but to scale down its services.

In response to the devastation, the Thurgood Marshall College Fund provided more than \$250,000 in scholarships to displaced Southern students. The scholarships typically were \$500 grants to cover students' tuition, books, clothing, and essential living expenses. The grants were also available for displaced faculty. The fund also arranged for other Thurgood Marshall Scholarship Fund member schools such as Texas Southern University (Houston), Southern University Baton Rouge, and Southern University Shreveport (Louisiana) to assist displaced students.

Partnerships and Funding

In July 2005, the Thurgood Marshall Scholarship Fund received a \$361,460 grant from the Lumina Foundation for Education, Inc., to improve and increase the administration of financial aid at public HBCUs. The Lumina Foundation is committed to expanding access to higher education. The purpose of this partnership is to enhance student access to financial aid information and grants at 20 of 47 member institutions. Under this program, it is believed that 85,000 students will benefit from having more information about scholarships and grants that they would likely not know about otherwise. The program, rolled out over 2 years, focuses on three key areas on each campus: needs assessments, targeted training, and general training. By offering training built upon the existing skills of financial aid personnel, this joint program aims to increase efficiency and lead to stronger financial aid practices on the institutional level.

The Thurgood Marshall College Fund relies on corporate and foundation gifts for most of its support. According to Senior Manager for Development Lisa Van Putten, in fiscal year 2005, only 13% of gifts to TMSF came from individuals. The remaining 87% came from corporate, foundation, and government grants. Understanding that alumni consistently comprise the largest segment of individual gifts to colleges, universities, and educational foundations, and that corporate, foundation, and government funding priorities are changing, TMSF dedicates time and effort to increasing support of the fund by HBCU alumni. Increasing individual

support, especially that of alumni, is essential to the TMCF's survival.

TMCF launched an initiative to increase alumni participation at both the fund and institutional levels. Funded by the Lilly Endowment and conducted by the Indiana University Center on Philanthropy, TMCF provides workshops for alumni leaders to learn how to work productively with college development officers and how to solicit contributions from their fellow alumni. This program builds on a previous Center on Philanthropy series of workshops for development officers at TMCF member institutions.

Another program is known as the RADICAL Program (Reinventing Academic Development to Inspire Creative Achievement and Learning); the Gates-Marshall project was awarded \$4.9 million over 5 years by the Bill & Melinda Gates Foundation. The project both creates new and redesigns low-performing high schools in economically distressed areas. The program's goal is to create small model secondary schools of 400 students, primarily in the South. Each school is developed through partnerships between TMCF member institution and local public school districts. Each TMCF college provides programmatic support to teachers and administrators and allows for college course enrollment to the high school's students. TMCF serves as the intermediary and assumes fiscal responsibility and programmatic oversight for the newly created partnerships. To date, seven Gates-Marshall high schools are serving 3,000 students in Louisiana, Maryland, North Carolina, and Texas.

The Thurgood Marshall College Fund raised \$3,708,609 through contributions in 2005. This is far below the United Negro College Fund's contributions in the same year (\$169,408,629). TMCF is highly efficient, spending only 9 cents to raise each dollar in 2005.

Merit-Based Aid

Although the Thurgood Marshall College Fund was established to help public HBCU students that "did not have the financial resources to pay for their education," TMCF has consistently given merit-aid-based scholarships rather than need-based awards. Critics of TMCF's merit-based system suggest that a need-based granting system would be

more in accord with the organization's stated goals and would enable more African Americans to attend the colleges TMCF serves. They note that merit-based aid does not increase college access in the way that need-based programs do. Recently, many states have been cutting allocations to higher education and have replaced some of this funding with state-based merit-aid programs. Additionally, over the same period, there has been an expansion in federal aid, in the form of subsidized loans and tax breaks for middle-class families. According to the Harvard Civil Rights Project, programs for the middle class have grown substantially larger than federal aid programs for poor college students. In researching the new state merit-aid programs, Don Heller, Patricia Marin, and their colleagues found that these programs often aid students that are likely to attend college even if they did not receive the scholarship. In essence, students who benefit most from merit-aid programs often have little to no financial need. However, in changing the organization's mission in 2000, the TMCF did not expand their student scholarships beyond merit-based to need-based scholarships.

TRIO PROGRAMS

TRIO is the name given to eight educational partnership programs funded under the U.S. Department of Education. Their collective mission is to motivate and support students from

historically underrepresented backgrounds in order to increase these students' representation in colleges and universities. Through their various projects and activities, TRIO programs provide students with the necessary tools to complete high school and advance to postsecondary schooling. This entry looks at the historical context for these programs, their origins, and their description.

Historical Context

Historically, policymakers have viewed K–12 education and college attendance as the pathway to social mobility. However, this pathway has not been accessible to all people. Students from underrepresented groups and students from low-income families have disproportionately been excluded from educational resources, opportunities, and supports. Disparities among students are reflected in the college-going rates across racial, ethnic, and economic groups. In looking for resolutions, equity advocates have turned to projects outside of schools, such as partnership programs to address the problem of disparity.

Programs dedicated to providing extra support have become popular as a means for gaining equal representation within higher education. Referred to as educational partnerships, academic development, and prep programs, they are seen as the needed bridge to pick up where many public schools have failed to adequately provide opportunity for college access. The theory of action behind these prep programs is that through them, students who have been educationally disadvantaged will receive the support needed and have a better chance of attending postsecondary institutions. These academic development programs vary in approaches and include tutoring, counseling, and college assistance.

The history of prep programs represents the struggle in dealing with class and racial inequalities. Their development and implementation were born out of the turbulent 1960s. The United States experienced immense change through massive protests in which demands for social reform to correct the continuing unequal stratification between White and other people were frequent. Like never before, groups united in unprecedented numbers against institutional laws, which had for so long limited many groups to inferior ranks. Out of

these tumultuous times came one of the most progressive, social-oriented political agendas the United States had ever seen.

In looking to ameliorate social problems, the federal government saw the answer in education. In response to increasing demands for equity, President Lyndon B. Johnson turned to the public school system. Schooling was seen as the avenue to help overlooked and disenfranchised student populations increase their representation within higher education, whereby opening access to the potential for wealth accumulation. Through centralized government intervention, Johnson looked to overturn the destitute and deprived conditions leading to failure, by declaring a “War on Poverty” as part of his administration.

President Johnson's ideas for a more equitable society came to fruition in the form of supplementary educational assistance. In 1964, TRIO programs were created and launched. The theory was that through academic outreach programs geared to supplement traditional education, students from low-income and academically disadvantaged families would be offered the opportunities to adequately compete, allowing them to complete high school and matriculate onto college and beyond.

President Johnson the originator of such programs, early on showed a strong commitment to New Deal politics. His administration proposed one of the most drastic agendas geared toward closing various societal disparities. Johnson's concern with growing inequities and social unrest pushed him to fight hard for mandates that would close the class, racial, and economic gaps. In a speech to the University of Michigan on May 22, 1964, Johnson challenged the United States to join him in the fight for a more equal society:

The Great Society rests on abundance and liberty for all. It demands an end to poverty and racial injustice. . . . But that is just the beginning. The great society is a place where every child can find knowledge to enrich his mind and to enlarge his talents. . . . We must give every child a place to sit and a teacher to learn from. Poverty must not be a bar to learning, and learning must offer an escape from poverty. So, will you join in the battle to give every citizen the full equality which God enjoins and the law requires, whatever his belief, or race, or the color of his skin? Will you

join in the battle to give every citizen an escape from the crushing weight of poverty?

Acknowledging the historical injustices the Jim Crow era had legitimized and continued to perpetuate, Johnson looked to bring about centralized programs that would effect change. Claims of commitment to equality had lingered since the 1954 *Brown v. Board of Education* decision, but little had evolved within the schools. Schools continued to perpetuate a two-tiered system in which only a select few were given a quality education, while the rest, mostly students from underrepresented groups, were overlooked. President Johnson, along with equity supporters, did not choose to leave reform up to the individual school districts; massive centralized interventions were seen as the only viable option to be effective for inclusion of all students.

Built on the assertion that certain groups, because of historical injustices and continued unequal treatment, required supplementary help in order to equally compete alongside their White middle-class counterparts, President Johnson initiated various programs targeted at these populations. The programs would, in his eyes, help to eliminate poverty and racial injustice. One of the largest propositions Johnson passed was the Higher Education Act of 1965. This law brought a new focus to groups who historically had been grossly underserved by the public school system. The Higher Education Act reads as follows:

The Secretary shall carry out a program to be known as student support services which shall be designed—

- (1) To increase college retention and graduation rates for eligible students;
- (2) To increase the transfer rates of eligible students from 2 year to 4 year institutions; and
- (3) To foster an institutional climate supportive of the success of low-income and first-generation college students and individuals with disabilities.

This proposition was the first of its kind to move beyond the rhetoric, centralize an intervention, and allocate massive funding to underrepresented groups.

TRIO Is Born

In 1964, under the Higher Education Act, Upward Bound became the first program to be passed and piloted. Projects aimed at helping traditionally disadvantaged students continued to grow. A year later, in 1965, Talent Search was initiated. Special Services for Disadvantaged Students, today known as Student Support Services, was added under the 1968 amendments. This series of three gave TRIO programs their name, and it became the umbrella term for future projects with the same mission.

The umbrella expanded to include five more programs. In 1972, Congress added the Educational Opportunity Centers, and in 1976 the Training Program for Special Programs Staff and Leadership Personnel, which later changed its name to Training Program for Federal TRIO Programs. The sixth program added was the Ronald E. McNair Postbaccalaureate Achievement Program in 1986, and in 1990 Upward Bound Math/Science was added. The last addition to TRIO came in 1998 with the authorization of the TRIO Dissemination Partnership Program. Together, these eight programs comprise the TRIO family.

Upward Bound's mission is to support students from low-income and first-generation families in their successful completion of high school and matriculation into college. Through afterschool and weekend workshops and a rigorous summer school component, Upward Bound provides academic instruction in core courses, tutoring, counseling, and cultural enrichment activities.

Talent Search looks to recruit middle-school-aged students from historically underrepresented backgrounds and helps lead them into higher education. Program coordinators encourage the completion of high school and matriculation as well as successful completion of college. Services include tutoring, career counseling, and financial aid workshops. The program also strives to help high school dropouts reenter school and assists them in completing secondary schooling.

Student Support Services is a project set in place to motivate and encourage successful completion of undergraduate studies. The mission of this program is to increase retention among historically underrepresented groups. Services include assistance in the registration process, tutoring, financial and personal counseling, and career counseling.

The Educational Opportunity Center offers counseling and workshops on the college admissions process to adults looking either to continue or reenter postsecondary schooling. Program mentors assist clients in the application process as well as the financial aid process.

Training Program for Federal TRIO Programs supplies funding for the professional development of TRIO employees. This program provides staff with training in current financial aid rules, general project management, design and operation of model programs, and any other area deemed necessary for successful program management.

As its mission, Ronald E. McNair Postbaccalaureate Achievement Program prepares college students for doctoral work by engaging them in research. This program tracks students through their undergraduate experience and encourages application to PhD programs. Students are assisted through academic counseling, financial aid assistance, mentoring, research opportunities, summer internships, and tutoring.

Upward Bound Math/Science is specifically designed to foster the math and science skills of its participants. The program strives to recognize and develop students' math and science skills and encourage them to pursue postsecondary degrees in these areas. Program components include a rigorous summer program consisting of various classes and workshops, year-round counseling and introduction to and engagement of university faculty in mathematics and the sciences.

TRIO Dissemination Partnership Program works to bring together institutions serving students from low-income and first-generation college families. This program allows successful TRIO projects to reach out and work with institutions and community-based organizations that serve similar students but do not have a TRIO program, thus encouraging replication of successful TRIO activities.

TRIO programs are distributed across 1,000 different colleges and private agencies. Projects are contracted out to institutions and organizations where there is most need. Programs are independently run but must maintain the mission of the program and follow strict guidelines and regulations. All programs are evaluated annually to ensure they are performing as required. Through the various projects, TRIO looks to increase student higher

education access. To date, TRIO has focused on increasing student populations at postsecondary institutions. The mandate to serve the economically underrepresented within the eight programs has made them distinct from other academic outreach programs. Further, their diversity shows the great possibilities these programs have in closing societal gaps.

TUREAUD V. BOARD OF SUPERVISORS

Alexander Pierre Tureaud, Jr. et al. v. Board of Supervisors of Louisiana State University and Agricultural and Mechanical College is a class action suit filed in the U.S. District Court for the Eastern District of Louisiana in 1953. The purpose of the suit was to obtain a preliminary injunction against the Board of Supervisors of Louisiana State University (LSU) and Agricultural and Mechanical College. Alexander Tureaud Jr. had applied for admission to the university's unique undergraduate 6-year prelaw and law degree program and been turned down. Eventually, a court ruled that state-supported universities could not deny admission on the basis of race. This case is significant to the political and legal history of African Americans in education because it came at a pivotal time in the fight to desegregate public universities. To understand the importance of this case, one must put it in the context of the legal history of the civil rights movement in higher education. This entry explores the background, the facts, and the significance of the Tureaud case.

Historical Background

Tureaud was born and raised in New Orleans, Louisiana. He was the son of Alexander P. Tureaud Sr. and Martha Hawkins. His father was the famed civil rights attorney who graduated from Howard University Law School in 1925 and was the only African American practicing attorney in Louisiana from 1937 to 1947. After completing his elementary and secondary education in the segregated New Orleans public schools, Tureaud applied for admission to LSU's undergraduate program. Because of his father's civil rights prominence, it would be natural for Tureaud to make application to the segregated LSU. However, he commented that his father did not influence his decision to

apply. He stated, "One day I just decided to attend LSU. My father always gave you the feeling that you could do what you wanted to do and it would be okay."

The Impact of Jim Crow

Postreconstruction Southern states, however, in an effort to reestablish White supremacy, had ushered in a period commonly referred to as the "Jim Crow era" (1877–1954). To reestablish White supremacy, the Southern power structure passed laws to keep the races completely separate. This was accomplished by legally disenfranchising African Americans. Southern courts also passed legislation that outlawed intermarriage, segregated all public facilities and accommodations, and created an economic system that tied the previously enslaved African labor force once again to the land. In the area of education, according to John Hope Franklin, "By 1985, most Southern states had laws that required separate schools. With the adoption of new constitutions the states firmly established the color line by the most stringent segregation of the races."

To challenge segregation, African American leaders and their White supporters turned to the courts. However, in 1896, the U.S. Supreme Court dashed their hopes for relief. The Court, in *Plessy v. Ferguson*, established the "separate-but-equal doctrine," which legalized the separation of the races in public facilities and accommodations. This decision confirmed that the act of separating the races was not a violation of equal protection clause of the Fourteenth Amendment of the U.S. Constitution. Therefore, it was legal for states, like Louisiana, to have public universities for Whites as long as the states also provided equal postsecondary institutions for African American students.

During the first half of the 20th century, African Americans continued to fight to achieve their goals in federal courts. However, courts were reluctant to intervene in the affairs of colleges because of colleges' in loco parentis role. A Kentucky court in *Gott v. Berea College* (1913), commenting on the authority of college administrators, stated, "We are unable to see why, to that end, they may not make any rules or regulations for the government or betterment of their pupils than a parent could for the same purpose."

National Association for the Advancement of Colored People Strategy

Blacks, under the leadership of the National Association for the Advancement of Colored People (NAACP), began their higher-education fight in the area of graduate and professional education. They attacked this area first because African Americans were denied admission to all-White graduate and professional schools, and most states did not offer this level of education to African Americans. African Americans sought and achieved success in three areas.

First, in 1936, Lloyd Gaines applied and was rejected from the all-White law school at the University of Missouri because of its policy of not admitting African Americans. He appealed the decision to the U.S. Supreme Court, and in 1938, in *Missouri ex rel. Gaines v. Canada*, the Court found that denying Gaines admission was a violation of the equal protection clause of the Fourteenth Amendment. Missouri was denying the privilege of legal education to their African American citizens while providing it to Whites. Moreover, the Court indicated that the practice of states providing scholarships for African Americans to attend schools out of state was discriminatory and a violation of the equal protection clause.

Second, African Americans began to attack the quality of graduate and professional schools established by the states for African Americans. They argued that graduate programs established at these schools were unequal and therefore inferior to those at segregated White universities. In 1950, the U.S. Supreme Court ordered the law school at the University of Texas to admit Heman Sweatt. In *Sweatt v. Painter*, the Supreme Court determined that the separate law school established for African Americans could not be equal to that of the University of Texas law school. The criteria used by the Court when arriving at its decision included the quality and experience of the faculty and administrators; the number of library holdings; and the school's influential alumni, community reputation, prestige, and traditions. The Court established that Sweatt had a constitutional right to the same quality of legal education afforded White citizens of the state; and to deny this right was a constitutional violation.

Finally, the third area that African Americans attacked in their efforts to erode the "separate-but-equal" doctrine began when G. W. McLaurin applied and was admitted to the Graduate School at the University of Oklahoma as a candidate for the doctorate in education. In 1948, the U.S. Supreme Court, in *Sipuel v. Board of Regents of University of Oklahoma*, had already ordered the law school at the University of Oklahoma to admit Ada Sipuel, who had been rejected because of her race. Therefore, in *McLaurin v. Oklahoma Regents for Higher Education* (1950), the plaintiffs accepted McLaurin to the university, but he was segregated in all areas of the campus life. He was physically separated from his White classmates in the classroom, library, and cafeteria. McLaurin sued the university, stating that "such restrictions impaired and inhibited his ability to study, to engage in discussions, exchange views with other students, and, in general, to learn his profession." In 1950, the Court held that segregating McLaurin deprived him of an effective graduate education.

This was the historical context in which the *Tureaud* case evolved. African American leadership took steps to chip away at segregation with the assistance of federal courts. However, their higher-education successes dealt with graduate or professional education; the *Tureaud* case was the first dealing with undergraduate education. When Tureaud submitted his application for admission to LSU in June 1953, the stage already had been set by the Supreme Court decisions in the *Gaines*, *Painter*, and *McLaurin* cases.

Facts of the Case

On August 8, 1953, when LSU rejected Tureaud's application, the scene was set to attack undergraduate education for African Americans. Tureaud had the option of attending Southern University, which offered the program of study; however, the dean of the law school indicated that because of the "extremely tight undergraduate requirement we have been unsuccessful in perfecting the program. To date we have not had one person to qualify under this program though several have tried and made steady progress at it."

Tureaud's case was heard on September 8, by Judge James Skelly Wright. He was known for his position that the state of Louisiana must recognize

African American civil rights. Although Tureaud's attorneys wanted a hearing by a three-judge panel, Judge Wright refused, indicating that the issues of the case had already been adjudicated by the court.

Robert Carter, a NAACP lawyer from New York; U. Simpson Tate, a lawyer from the NAACP Southwest Regional Office; and Antoine M. Trudeau Jr., a local lawyer represented the plaintiff in this case. Trudeau's father, Alexander Pierre Tureaud Sr. could not handle the legal arguments because he was also a plaintiff in the case.

Tureaud's attorneys based their request for a preliminary injunction against LSU because of the university's policy of denying admission to African American students who applied to their undergraduate division. They also argued that the program at Southern University was not of equal quality to the LSU program. They indicated that African American students completing the arts and science program at Southern University would not be awarded the arts and science degree by LSU once they successfully completed their first year of law school. However, White students at LSU who completed the art and sciences program would receive their degree after their first year of law school. The defendants, in response to this argument, stated that African American students who completed their arts and sciences work at Southern University and completed their first year of law school at LSU might return to Southern and obtain an arts and sciences degree.

The Court Ruling

Judge Wright indicated in his opinion that denying admission to qualified African American applicants solely because of their race was a violation of the equal protection clause of the Fourteenth Amendment. He also indicated that African American citizens and residents of the state of Louisiana must be afforded the same rights and access given to others. Utilizing the criteria the Supreme Court provided in *Sweatt v. Painter*, Judge Wright compared the combined arts and sciences and law programs at Southern University and LSU. He found that the program at Southern University was substantially unequal in all areas. Therefore, on September 11, Judge Wright ruled in favor of the plaintiff and granted the preliminary injunction requiring LSU to admit Tureaud to the undergraduate school.

On September 14, 1953, 3 days later, Tureaud arrived in Baton Rouge to begin his freshman year at LSU; however, he was not permitted to register. Robert Brooks, an LSU attorney, informed Tureaud and his father that the university had applied for a new trial and an order to stay the execution of the preliminary injunction. His father immediately contacted Judge Wright, and a new trial was set for September 16, after it was determined that Tureaud had until September 18 to register for classes.

LSU argued, during the second hearing, that Judge Wright was in error by not convening a three-judge panel, a claim that was not made by the defendants during the first trial. Judge Wright rejected the motions and refused to rescind the preliminary injunction. On September 18, Tureaud registered as a freshman; however, LSU considered his registration conditional pending further court action.

Appeals Process

LSU filed an appeal to the Fifth Circuit Court of Appeals. The court on October 28 reversed the decision of the lower court on the technicality that a three-judge court should have heard the case. Chief Judge Joseph Chappell Hutcheson Jr. and Judge Robert Lee Russell ruled for defendants. Judge Richard Rives, writing a very strong dissenting opinion, argued that the case did not warrant having a three-judge panel in federal statute or case law. He also supported Judge Wright's handling of the case when he stated that "this case presented, I think, purely a factual question, the decision of which was for the district judge, and commendably he shouldered the responsibility imposed upon him by law." Therefore, on November 9, Judge Wright vacated the order requiring that Tureaud be enrolled at LSU. On November 10, LSU wrote the following letter to Tureaud:

Please be advised that your registration in the LSU undergraduate division has been cancelled. . . . This action was done because the temporary preliminary injunction issued by the Federal District Court, under which you were admitted . . . has been vacated and set aside by the Court of Appeals.

In response, Tureaud's attorneys filed a petition for certiorari to the U.S. Supreme Court to stay the

Fifth Circuit's decision on November 16, 1953. The Supreme Court granted the stay; however, Tureaud had already left LSU and never returned. He enrolled and ultimately graduated from Xavier University. On May 24, the Supreme Court, in a per curiam decision covering three civil rights cases, vacated the Fifth Circuit's decision and remanded Tureaud's case given its recent decision in *Brown v. Board of Education, Topeka, Kansas* (1954). In *Brown*, the Court established that the "separate-but-equal doctrine" that was established in *Plessy* was unconstitutional. Therefore, on August 23, a three-judge panel of the Fifth Circuit affirmed Judge Wright's initial judgment and reinstated the preliminary injunction again LSU. However, the LSU Board appealed once again, requesting a rehearing of the case.

On October 26, 1954, the court entered an order granting a rehearing and setting aside the preliminary injunction given the mandate of the Supreme Court in *Brown*. On November 8, 1955, the Fifth Circuit determined that the case would be heard en banc without oral arguments. The court, with one dissent, vacated the October 26, 1955, and remanded the case to the "district court for further and not inconsistent proceedings including its disposition on the merits." LSU filed a petition for a writ of certiorari to the U.S. Supreme Court that was denied on May 5, 1956, without comment.

Impact of the Ruling

This decision ended the legal history of *Tureaud v. Board of Supervisors*. The reinstatement of the preliminary injunction, while not directly affecting Tureaud, had a major impact on future African American applicants who applied to the undergraduate programs. The case established that state-funded universities could not deny admission to students because of their race. African Americans began to enroll in the undergraduate school at LSU in 1960, and Ernest N. Morial was the first African American graduate of LSU Law School.

TUSKEGEE UNIVERSITY

Tuskegee University is a state-related and independent historically Black institution located in Tuskegee, Alabama, that has a teaching and research emphasis. Its first president, Booker T. Washington, and an early faculty member, George Washington Carver, are among the illustrious figures associated with the university. The only college or university designated a National Historic Site by the U.S. Congress, Tuskegee is home to the George Washington Carver Museum, the Oaks—Washington's home—and the Tuskegee Airmen National Historic Site.

The School of Veterinary Medicine is the only one of its kind at a historically Black institution, and the school produces more than 75% of African American veterinarians in the world. Tuskegee is also the number one producer of African American aerospace science engineers in the nation and a leading source

of chemical, electrical, and mechanical engineers. In addition, the university is home to the winningest Black college football team in the United States.

The university comprises five academic colleges, specifically, the colleges of Agricultural, Environmental, and Natural Sciences; College of Business and Information Science; College of Engineering, Architecture and Physical Sciences; College of Liberal Arts and Education; and the College of Veterinary Medicine, Nursing and Allied Health. Approximately 50 majors are offered that lead to baccalaureate, master's, professional, and doctoral degrees.

The university consists of a coeducational student body of roughly 3,000 undergraduate and graduate students who represent 48 states and more than 30 countries. Spread over 268 acres, Tuskegee occupies 161 buildings, and total property exceeds 5,000 acres. This entry traces its history by looking at the five men who have led Tuskegee University over its first 125 years.

Booker T. Washington

Founded in a one-room shanty at Butler Chapel African Methodist Episcopal Zion Church, Tuskegee was the project of George Campbell, a past enslaver, and Lewis Adams, a formerly enslaved African. On July 4, 1881, Alabama House Bill 165 was passed, allocating a \$2,000 appropriation for teacher salaries. There was no physical property or buildings; however, there was state authorization for the establishment of the school to educate Macon County residents. Campbell, through his nephew, was seeking a teacher to run Tuskegee, and he recruited an individual from Hampton Institute. Booker Taliaferro Washington was called on to be the first principal.

Born enslaved around 1856 in Franklin County, Virginia, Booker T. Washington became one of the most preminent leaders in U.S. history. Washington worked in a salt furnace and in coal mines; he was educated at Hampton Institute and mentored by General Samuel Chapman Armstrong. He was rooted in the industrial education philosophy of “working with the hands” coupled with the use of morality, decency, and order.

As Tuskegee's first principal, Washington is one of the best-known Tuskegee leaders. He developed Tuskegee as a magnet for White northern industrial

dollars, raising millions for the industrial institution. Trades such as sewing, cooking, harnessing, carpentry, brick making, and machinery were mainstays of the Washington curricula. His philosophy did not win the favor of some Whites, who claimed that educating the African Americans would lead to the economic devalue of their industries and might lead African Americans to not want to work in domestic positions.

In the early years of instruction at Tuskegee, students had an inflexible schedule of studying and working. By 1888, students woke up at 5:00 in the morning and went to bed at 9:30 nightly. In lieu of tuition and fees, Tuskegee students helped in the construction of the dining facility, girl's dormitory, chapel, and classrooms. Many of these buildings are still in use today.

Washington delivered a speech at the Atlanta Cotton States and International Exposition in 1895. In this speech, Washington calls for African Americans to “cast down your bucket where you are—cast it down in making friends in every manly way of the people of all races by whom we are surrounded.” Washington articulated that African Americans are content with their social position in life and that they should strive for further vocational training and self-economic advancement.

Washington worked alongside notable faculty like George Washington Carver, who arrived at Tuskegee in 1896 to become the director of agriculture. In this position, Carver realized that farmers needed new farming methods. He pushed the farmers away from cotton to peanuts and soybeans and taught them self-sufficiency and conservation. He felt that his most important method for educating farmers was the Jessup Wagon concept, a university rural farming extension practice initiated by Carver using a mule and wagon, and later the automotive Jessup Wagon, to teach farmers new production techniques on their farms. Created in 1906, it was a “laboratory on wheels” that brought new approaches to the farmers.

Washington continued his philosophy of uplifting African Americans through practical education with the establishment of the Negro Business League (NBL) in 1900. Booker T. Washington taught his people to embody “economic empowerment” through the creation of his Negro Business League.

In 1901, Washington became the first African American person to dine in the White House via

invitation of President Theodore Roosevelt; until his death, he counseled many U.S. presidents. A \$2 million endowment, 1,500 students, 40 trades, 100 buildings, and roughly 200 faculty were on hand at the time of Washington's death.

Robert Russa Moton

Washington died in 1915 on the campus of Tuskegee, and Robert Russa Moton succeeded him. Moton had been Washington's friend and was considered to be "safe, sane, and conservative" by the Tuskegee Board of Trustees. He was also an alumnus of Hampton Institute, and after graduating, he became the commander in charge of military discipline at Hampton Institute. He continued the advancement of Tuskegee by expanding the physical plant and adding a junior college and 4-year college program to the institute.

With Moton's assistance, the following major academic and student life buildings were added: Samuel Chapman Armstrong Hall, the William G. Willcox Trade Buildings, James Chambliss Building, a greenhouse, Chambliss Children's House, the dairy and horse barn, Margaret Murray Washington Hall, Logan Hall, and the main library—Hollis Burke Frissell Library.

Baccalaureate degrees with majors in education, agriculture, home economics, and mechanical industries were added under Moton's administration. This move was inevitable because of the pressure that came from state officials about academic standards for African American educators. White supremacy was a prevalent mainstream philosophy during this time, and African American educators were needed in order to combat this racism. Like Washington, Moton enjoyed access to wealthy White men and foundations, and he secured many endowments for Tuskegee. He also became a counsel to many U.S. presidents.

In 1932, the U.S. Public Health Service conducted a research study under Moton's administration. The focus of the study was to record the history of syphilis in African Americans. The government named the study the "Tuskegee Study of Untreated Syphilis in the Negro Male." Roughly 600 men were subjects in the study; 399 were a part of the experimental group, and 201 were control subjects. This study took place on the campus of Tuskegee Institute.

None of the participants were told that they had syphilis, and the Public Health Service not only denied them adequate treatment but also went to some length to ensure that the 399 members of the experimental group were not treated by other health providers who became aware of their disease. When the methods of the study became public, there was a considerable outcry, and the outcome has been significant changes in the ways in which informed consent and research is conducted at U.S. institutions.

Moton served Tuskegee until his declining health led to his resignation in 1935. He died in 1940 and was buried at his alma mater, Hampton Institute.

Frederick D. Patterson

Named after journalist and abolitionist Frederick Douglass, Frederick D. Patterson succeeded Moton as president. Born in October 1901, Patterson attended Iowa State College, where he obtained a doctorate in veterinary medicine, and Cornell University, where he received a second doctorate. Patterson was instrumental in bringing the only school of veterinary medicine to a historically Black institution in 1944. He headed the veterinary division, directed the agricultural school, and was then named president of the university. Another one of Patterson's major accomplishments was the establishment of the United Negro College Fund (UNCF).

In the same year he started the veterinary medicine school, the UNCF was launched. Spurred by a lack of fund-raising, Patterson wrote a letter to the *Pittsburgh Courier* requesting that Black college presidents across the country pool together to form an organization to raise money for all private Black institutions.

Patterson was also instrumental in bringing a famed flight program to the university, later called the Tuskegee Airmen. This all-Black squadron included decorated World War II veterans and became the first African American military air squadron in the United States. Racism was rampant at this time, and many people believed that African Americans lacked the skill and courage to fly fighter jets. In order for individuals to be selected, highly competitive qualifications were enacted; most of the airmen were college graduates or undergraduates, or they passed entrance examinations. Patterson

served as president of Tuskegee until 1953. U.S. President Ronald Reagan bestowed upon him the Presidential Medal of Freedom, the highest civilian award, in 1987, and a year later, Patterson succumbed; he is buried on Tuskegee's campus.

Luther Hilton Foster

Luther Hilton Foster succeeded Patterson as president of Tuskegee in 1953. He was born on the campus of St. Paul's College in Virginia; his father was a college administrator there. Foster received degrees from Virginia State, Hampton, Harvard, and the University of Chicago. Foster headed Tuskegee for 28 years, longer than any other Tuskegee leader. He led the university through the civil rights movement and student activism. Student Nonviolent Coordinating Committee (SNCC) member and Tuskegee student Sammy Young's activism characterizes the university's involvement in the movement. Sammy Young was one of the first African American students to die in the liberation movement. Also, the court case *Gomillion v. Lightfoot* (1960) speaks to the influence that Tuskegee played during these transformational years. This case found that an electoral district that was set up to disenfranchise African Americans was a direct violation of the Fifteenth Amendment.

Foster faithfully served as president of Tuskegee until 1981, and his successor, Benjamin Payton, described him as "quiet but firm." His legacy was marked permanently in 2002 by the naming of the engineering building on Tuskegee's campus. Foster created the engineering programs during his tenure; the building is now named Luther H. Foster Hall. Foster passed away in 1994 in East Point, Georgia.

Benjamin Franklin Payton

Since 1981, Benjamin Franklin Payton has served Tuskegee University as president. After the retirement of Luther Foster in 1981, the board of trustees sought a person who had national exposure and was an outsider to the Tuskegee community, according to Board Chairman Andrew F. Brimmer. Payton earned degrees from South Carolina State

University, Harvard University, Columbia University, and Yale University, and prior to joining Tuskegee, he was program officer of Higher Education and Research at the Ford Foundation and president of Benedict College, a historically Black college in Columbia, South Carolina.

Some of Payton's accomplishments include the establishment of the General "Chappie" James Center for Aerospace Science Engineering and Health Education, the creation of two PhD programs in material science and engineering and integrative biosciences, and establishment of the National Center for Bioethics in Research and Health Care. He developed the Kellogg Conference Center at Tuskegee University, which is one of 12 Kellogg Centers in the world. Of note, Payton to date has raised more than \$200 million for the university.

Tuskegee University is unique in that it has only had five presidents since its founding in 1881. The university celebrated its 125-year anniversary in 2006, and it has a renewed vision to continue the work of Booker T. Washington. Payton announced his retirement in the spring of 2009, effective June 2010.

U

UNITARY STATUS

Unitary status is a legal status of a school district, indicating that the district—formerly under a court-mandated desegregation order—has achieved, to the extent practicable, the court’s requirements regarding desegregation. Once districts believe the mandates of their individual court desegregation orders have been met, they can apply for unitary status. When the court grants this status, the court desegregation order is lifted. The district is then no longer subject to court oversight. Without court oversight, unitary districts may return to a system of neighborhood schooling, which often results in rapid resegregation. Beginning with the 1991 U.S. Supreme Court case of *Board of Education of the Oklahoma City Public Schools v. Dowell*, unitary status rulings have brought about huge rises in segregation in places where increased desegregation was once predominant. This entry looks at the history of court rulings about unitary status.

Gaining Unitary Status

Beginning with the *Brown v. Board of Education of Topeka, Kansas*, ruling in 1954, the U.S. Supreme Court required public school districts to dismantle dual schooling systems and take the necessary steps to create *unitary* systems. In this context, dual systems were school districts that had imposed de jure segregation by mandating within state laws and constitutions that African American

children would be educated separately from White children. This 1954 U.S. Supreme Court decision intended to abolish such systems and replace them with unitary systems. The unanimous opinion of the court was that “separate educational facilities are inherently unequal,” thereby overturning the long-standing separate-but-equal precedent established in the *Plessy v. Ferguson* case of 1896.

In the 1968 *Green v. County School Board of New Kent County* case, the Supreme Court further clarified what was meant by a “unitary system” by identifying six factors that federal courts must consider when determining a district’s progress toward a unitary system: the racial composition of the student body, faculty, staff, transportation, extra-curricular activities, and facilities. Subsequently, these items are also known as *Green* factors. Districts under court-mandated desegregation orders were required to demonstrate that they were doing everything possible to make progress in all six areas in their pursuits of unitary systems.

In the stride toward dismantling segregation, the Supreme Court further sought to uphold racial balancing in public schools when it ruled in the 1971 *Swann v. Charlotte-Mecklenberg Board of Education* case. The court upheld the use of mathematical ratios of White to African American students as starting points for the desegregation process; it also permitted the pairing of noncontiguous school zones as well as the use of busing where the assignment of children to the school nearest their homes would not produce effective results in the attempt to dismantle dual systems of schooling. After this ruling, all three remedies

were implemented as reasonable and effective desegregation tools. It has been suggested that the *Swann* decision promoted remarkable strides in school districts located in southern states and bordering states, as schools in these areas became the most integrated in the nation.

By using a variety of desegregation tools, school districts were able to make steady, though often slow headway in the transition from racially dual systems to desegregated, unitary systems. Nevertheless, many lower courts expressed divergent understandings of both the substantive accomplishments and procedural steps that would enable a dual school system to be declared unitary. In the 1991 *Board of Education of the Oklahoma City Public Schools v. Dowell* case, the Supreme Court specifically addressed the standards required for achieving unitary status.

At that time, the Court held that a declaration of unitary status is appropriate only after a hearing at which the defendant school district bears the burden of proof for accomplishing each of the following: compliance with the desegregation order for a reasonable period of time; the elimination of all vestiges of past discrimination to the extent practicable—including compliance to all six *Green* factors; and a good faith demonstration of its commitment to the constitutional rights that were the predicate for judicial intervention.

The Supreme Court reasoned that a desegregation order was not intended to be judicial tutelage for the indefinite future, and when a district complies with the aforementioned guidelines, it should be declared unitary. With this ruling, Oklahoma City schools became the first school system to be declared fully unitary and to achieve unitary status after 19 years of court-ordered desegregation.

Incremental Release

Just 1 year following the *Dowell* case, the Court's decision in *Freeman v. Pitts* (1992) allowed courts to relinquish control of school systems incrementally. If the federal court found a school system to be making a good faith effort to comply with the requirements of their court order, they were justified in returning control over certain areas (areas where the district was

in compliance with certain *Green* factors) to the school board—even if compliance with all of the desegregation order and all of the *Green* factors was not achieved. As such, a district could be declared partially unitary and therefore partially relieved of court oversight.

The *Freeman v. Pitts* ruling also recognized that a federal court could exercise its discretion not only to address the *Green* factors, but also to ask whether other aspects should be specified and to ascertain if African American students were being disadvantaged in ways that necessitated the development of additional strategies to ensure full compliance with the court order. Such reasoning was most notably used in the *Missouri v. Jenkins* (2000) case when the Eighth Circuit Court reversed the district court's declaration of unitary status. The court considered the use of standardized test scores as an indication of inequality in education and interpreted the achievement gap between White and African American students as a vestige of prior segregation.

Given the legal history of desegregation, unitary status is essentially a legal term used to describe the status of a district that has complied with its court desegregation order to eliminate the vestiges of segregation in accordance with all six *Green* factors and whatever other remedies lower courts deem appropriate.

UNITED NEGRO COLLEGE FUND (UNCF)

The United Negro College Fund (UNCF) is the nation's largest and oldest fund-raising organization for African American education. Founded by Frederick D. Patterson in 1944, it continues to provide operating funds and scholarships for 39 historically Black colleges and universities (HBCUs). Although the fund's strategy has changed over the years, it continues to provide important support for HBCUs. This entry begins with the historical background around the fund's founding, describes its early years, and then looks at how it responded to the challenges of a postsegregation world.

Social and Educational Context

When Patterson became president of Tuskegee Institute in 1935, he quickly realized that his institution—and Black colleges in general—were in the midst of a fund-raising crisis. Among the problems Patterson confronted was the state of wealth in the United States. The golden age of fund-raising came crashing down in economic ruin and social chaos as the Great Depression followed in the wake of the stock market crash of October 1929. This bitter climax to the false prosperity of the 1920s brought an end to the most productive era of voluntary giving the country had ever witnessed.

Many of the wealthy people who had given to Tuskegee under presidents Booker T. Washington and Robert R. Moton had lost their money in the Great Depression and had not yet found ways to recover. Others had died, and their children lacked the philanthropic interests of their parents. Still other wealthy donors were angry with President Franklin D. Roosevelt and his administration for their increased taxation of the rich. Typically, these conservative donors argued that private philanthropy, rather than the government, should provide relief for the poor. When Black college presidents approached wealthy individuals, the typical response would be to go ask Roosevelt for support; he took our money.

Patterson could see the writing on the wall: Black colleges were in dire financial trouble. As a result of the financial difficulties felt throughout

the nation, between 1930 and 1940 several of the better-known small Black colleges, including Roger Williams, Mary Allen, Walden, and Howe Institute, closed their doors. Some of the more nationally known Black colleges were merging in order to survive. Under the guidance of John Hope, Atlanta University had become the graduate university of the Atlanta University Center (which included Spelman, Morehouse, and Atlanta University). Likewise, New Orleans and Straight Colleges merged to form Dillard University. Other institutions, which were once private, had their grounds and facilities taken over by state governments in an effort to survive. These “new” state institutions included Fort Valley State, North Carolina College, and Jackson State (Mississippi).

The later 1930s and early 1940s were a pivotal time for African Americans in the United States; the nation was experiencing racial friction on a national scale, and the “Negro problem” was at the forefront of U.S. minds, with the publication of Gunnar Myrdal's *American Dilemma*. The National Association for the Advancement of Colored People (NAACP) was crafting legal challenges to segregation at the graduate level; A. Philip Randolph was preparing for his March on Washington to protest segregation in war-related employment and the military; and James Farmer organized the Congress of Racial Equality (CORE) to campaign against segregation in public accommodations.

In the midst of this atmosphere, Patterson found it difficult to run Tuskegee in an efficient manner while meeting the needs of poor students. After much frustration with the fund-raising situation, Patterson began to correspond with a group of Black college presidents about the challenges of raising money and possible solutions to these problems. The majority of college presidents wrote back to him detailing their similarly bleak financial situations and providing anecdotes about the difficulty of approaching foundations for funds. Patterson realized from his correspondence that Black college presidents were competing for the same small pool of funds—everyone was soliciting the same organizations and the same donors.

A New Organization

In 1943, in response to this critical situation, Patterson crafted the idea of a united appeal for

private Black colleges. Among the models Patterson looked into developing his idea was the March of Dimes National Foundation for Infantile Paralysis. This campaign pushed giving in a new direction by reaching out to the average citizen rather than focusing exclusively on a small number of wealthy donors. On April 25, 1944, Patterson established the United Negro College Fund with 27 member colleges and a combined enrollment of 14,000 students.

Internal Consensus

Eighteen Black college presidents came to the initial meeting of the United Negro College Fund, including Dillard University's Albert Dent, Spelman College's Florence Read, Atlanta University's Rufus Clement, LeMoyne Owen College's Hollis Price, and Morehouse College's Benjamin Mays. Patterson invited the college leaders to meet with a representative from the John Price Jones fund-raising firm, a firm with which Tuskegee had worked in 1925.

Some of the college presidents thought the idea of the UNCF would not work. Buell Gallagher of Talladega, for example, came to the meeting with a paper in hand that detailed the myriad reasons the idea was flawed. Thomas Elsa Jones, then president of Fisk University, was highly skeptical but eventually became one of the fund's most valued participants. Jones's main concern was the distance that would emerge between the individual Black colleges and donors when the UNCF served as the conduit. President Gallagher decided not to join because he thought the combined fund-raising effort would weaken the strength of the individual colleges. However, after the UNCF had a successful first year, he changed his mind.

In the words of the Frederick D. Patterson, one of the most important goals for the UNCF was to help provide funds for operating budgets—10% of each member college's budget. Even more important was educating the United States as to the contributions that Black colleges and their graduates had made throughout the nation. Because the monetary goal was to be achieved through public relations, publicity and the establishment of a national presence became the major focus of the organization. Specifically, the UNCF sought to raise funds for member colleges; promote better public understanding and appreciation of the

needs and problems of African Americans through fund-raising; and set an example of interracial cooperation in the UNCF's national campaign.

Of course, the organization had a daunting task ahead of it in a time of uncertainty throughout the country—the United States was in the midst of World War II. In addition, the idea of raising funds through interracial cooperation was a new concept that would not be welcomed by everyone.

Rockefeller's Role

From the start, Patterson wanted to create an organization led by Blacks working on behalf of Black institutions. However, during its early years the UNCF was merely a new face on 20th-century industrial philanthropy. As a result of his previous interactions as a college president with the General Education Board, Patterson easily convinced John D. Rockefeller Jr. to publicly endorse and financially support the UNCF. Patterson emphasized the importance of leadership and the significance of such endorsements in fund-raising campaigns.

Rockefeller Jr. was intrigued by the idea because it was consistent with his family's perspective as well as his politics. Patterson sold him on the UNCF by couching it in the framework of Black self-help. The industrialist came to the endeavor with a background that lauded "pulling oneself up by the bootstraps" and with an obsession with convincing the public that capitalism was benign. Rockefeller Jr., therefore, was easily convinced that the UNCF was a good idea and was confident he could persuade others to back the cause. Almost immediately, he convinced the Julius Rosenwald Fund to join him in supporting the UNCF with a \$25,000 donation.

Rockefeller Jr. initially maintained a tight grip on the UNCF's everyday activities. Although Patterson and his Black colleagues were the leaders of the organization, the rules were crafted by those Whites who, with their money, made the UNCF possible during the early days. As such, during the mid-1940s, the UNCF publicly acted and represented itself in a conservative manner, portraying Black college students as loyal, hardworking citizens—an image that Rockefeller Jr. could use to bring in large sums of philanthropic support. Behind the scenes, the African American leaders desired integration and equality of all kinds—economic, political, and social.

In the early years, the African American leaders of the UNCF operated behind a veil, working within the confines of a White world. During this same time, the UNCF built its infrastructure and fund-raising base. The UNCF provided a mechanism for businesses to give to higher education in a systematic and continual fashion rather than for ad hoc projects as they had in the past. It was during this time that the UNCF's National Women's Committee made strides in the New York City area, raising funds while also challenging societal taboos and pushing the boundaries on interracial socializing.

Responding to *Brown*

With the landmark *Brown v. Board of Education, Topeka, Kansas*, decision in 1954, the UNCF changed its public image. In light of the U.S. Supreme Court's pronouncement that segregated environments were inferior, the UNCF faced the dilemma of how to represent its all-Black campuses without seeming to be against integration. At this time the UNCF's African American leadership focused on the benefits of attending Black colleges as well as the possibility of integration. By the mid-1960s, several philanthropic organizations, including the Ford and Carnegie foundations, began to question whether Black colleges should exist at all.

In cooperation with prominent researchers, these foundations attempted to evaluate the performance of the Black institutions. Some of the reports issued by foundations contained blistering attacks, denigrating the colleges for mismanagement and low academic standards, and creating the need for a robust defense by the UNCF. As part of this defense, the fund began to change the way it presented Black colleges to the public. Combined with more militant students on Black college campuses, the attacks forced the UNCF to embrace a new Black-centered image and to become more activist in the public stances it took.

The images used to represent the 39 member colleges were no longer conservative and docile, but instead assertive, active, and spirited. These changes also reflected a shift in African American consciousness taking place throughout the country—a groundswell felt within the UNCF leadership. Black leaders of the organization were now at the helm, proactively representing the colleges to the public by, for example,

meeting with U.S. presidents, making public appearances, and advertising.

Spurred by a growing Black middle class, the 1970s brought about more change and a greater national presence for the UNCF. It was at this time that the UNCF coined the phrase, “A Mind Is a Terrible Thing to Waste”—a slogan that invoked a sense of compassion and obligation in many U.S. citizens who might not have previously given to Black education. No longer relying primarily on money from large philanthropies, the UNCF began to draw from a broader donor pool throughout the country. The 1980s and 1990s were a time of growth for the UNCF. New leadership, specifically the leadership of William Gray, shaped the organization into an efficient entity and designed more effective fund-raising strategies that helped raise \$1.6 billion for the member colleges. Perhaps the UNCF's greatest accomplishment was securing a \$1 billion gift from the Bill & Melinda Gates Foundation in 1999. Through this gift, the UNCF is able to offer scholarships to students in a fashion unparalleled by any other organization.

UNITED STATES V. JEFFERSON COUNTY BOARD OF EDUCATION

The case of the *United States v. Jefferson County Board of Education* (2007) is an affirmative action case in which the school district used race as a factor to decide student placement in efforts to voluntarily achieve racial desegregation. Jefferson County Public Schools (JCPS) used different attendance zones for African American and White students in order to decide student placement at three traditional magnet elementary schools. This entry chronicles *United States v. Jefferson Board of Education*, a case in which a White student was denied enrollment to a particular school based on race. The parent sued Jefferson County Public Schools, arguing that using race as a determining factor in student placement violated the student's Fourteenth Amendment right to equal protection under the laws.

Historical Context

In the *Brown v. Board of Education, Topeka, Kansas*, decision of 1954, the U.S. Supreme Court ruled that "separate-but-equal" schools were unconstitutional, based on the equal protection clause of the Fourteenth Amendment. It was not the inequality of the facilities but the fact of legally separating children on the basis of race on which the Court relied to find a constitutional violation in 1954. As a result, full compliance with the *Brown* decision meant school districts all over the nation were forced by law to achieve a system of determining admission to public schools on a nonracial basis.

In 1973, a federal court found that Jefferson County was not in compliance, as the school district had remained highly segregated. Approximately half of the district's population was White and about half was African American. Fourteen of the

district's 19 middle and high schools were nearly all-Black or all-White. Nineteen of the district's 46 elementary schools were between 80% and 100% Black. Twenty-one elementary schools were roughly between 90% and 100% White. In 1975, the district court entered a desegregation decree. Jefferson County Public Schools in Louisville, Kentucky, were integrated by court order until 2000 when the district court dissolved the decree after finding that the district had achieved unitary status by eliminating "to the greatest extent practicable" the remnants of its prior policy of segregation. After the release from the court mandate, JCPS implemented an enrollment plan in efforts to maintain substantial racial integration.

By the end of the decree, approximately 34% of the district's 97,000 students were African American, and most of the remaining 66% were White. Under the new enrollment plan, students were given school choice, but not all schools could accommodate all applicants. In such cases, student enrollment was decided based on criteria that included place of residence, school capacity, and random chance as well as race. In attempts to racially balance the schools, no school population was allowed to have an enrollment of Black students less than 15% or greater than 50% of its population.

At the elementary level, JCPS students are assigned to a "resides" school based on their address. Elementary resides schools are grouped into clusters in order to facilitate integration. Parents of kindergartners, first graders, and students new to the district may submit an application indicating first- and second-choice schools among schools within their cluster. If students do not submit an application, they are assigned with a cluster by the district. District policy states that decisions to assign students to schools within each cluster are based on available space within the schools and the racial guidelines in the district's student assignment plan, and if a school has reached the "extremes of the racial guidelines," a student whose race would contribute to the school's racial imbalance would not be assigned to that school. After all assignments have been completed, all students are permitted to apply to transfer between nonmagnet schools in the district. Students and parents may request transfers for any number of reasons; however, transfers may be denied as a result of lack of available space or on the basis of racial guidelines.

Facts of the Case

In August 2002, Crystal Meredith moved to the JCPS district. She enrolled her son, Joshua McDonald, in kindergarten for the 2002–2003 school year. Joshua's residence school was only a mile from his new home, but the school had no space assignments and the class was filled to capacity. JCPS assigned Joshua to Young Elementary, another elementary school in his cluster, which was located 10 miles from his home. Crystal Meredith attempted to transfer her son to Bloom Elementary, which was only a mile from their home but was not in their cluster. Space was available at Bloom and intercluster transfers were permitted, but Joshua's transfer was denied because JCPS stated that the transfer would have "an adverse effect on desegregation compliance." In other words, Joshua would disrupt the racial balance of the school.

It is not clear why the racial guidelines were even applied to Joshua's transfer application, since the guidelines do not apply at the kindergarten level. However, it was clear that Joshua's transfer application was denied based on his race, and his mother, Crystal Meredith, filed suit not because the guidelines were misapplied, but because Joshua's race was used as a determining factor at all.

Meredith alleged violations of the equal protection clause of the Fourteenth Amendment. Her suit was brought forth in the Western District of Kentucky. In earlier U.S. Supreme Court decisions (*Gratz v. Bollinger*; 2003; *Grutter v. Bollinger*, 2003), it was decided that race-based classifications must be directed toward a "compelling government interest" and must be "narrowly tailored" to that interest.

The Western District Court of Kentucky ruled that the district's plan to racially balance the schools was constitutional because the school had a compelling interest in maintaining racial diversity. The court held that though the plan paid "some attention to numbers," it did not constitute a rigid quota system, and according to the Supreme Court's precedents, rigid racial quotas are never narrowly tailored. Without issuing an opinion of its own (concluding that a written opinion "would serve no useful purpose"), the Sixth Circuit Court of Appeals upheld the district court. Meredith appealed to the U.S. Supreme Court.

Meanwhile, Joshua was granted a transfer to Bloom Elementary, the school to which the transfer was originally denied under the racial guidelines; however, racial guidelines apply at all grade levels. Upon Joshua's enrollment in middle school, he could again be subject to assignment based on race. Meredith pushed forward in her complaint, in addition seeking damages based on this possibility.

A Seattle Case

A similar case was on the horizon in Seattle. Seattle School District No. 1 had a policy similar to that of JCPS, in that both districts attempted to address de facto segregation tied in part to housing patterns. The purpose of the voluntary desegregation plans was to attempt to prevent the school districts from becoming members of de facto segregation with minority students isolated in inner-city schools and White students isolated in suburban schools.

Like JCPS, Seattle School District No. 1 decided to use race as a factor in deciding which students would attend particular schools. In Seattle, the school board set student enrollment at the district's most popular high schools within 15 percentage points of the overall balance of the district's students, which was 40% White and 60% non-White. While students were permitted to attend any of the district's 10 high schools, because some schools were more popular than others, the board created a racial tiebreaker to determine eligibility at the most popular schools.

If a new student would cause that particular school's White or non-White student population to increase above the 55% cutoff, the student was denied enrollment to that school. In the plan's first year, more than 300 White students were denied admission to their preferred school based on race. Thirty students left the public school system rather than attend their assigned schools. Parents who opposed the plan stated that Seattle schools were already diverse and that the race tiebreaker was an attempt to achieve unconstitutional racial balancing. Seattle School District No. 1 lawyers argued that the desire to integrate public schools is not the constitutional equivalent of seeking to maintain a segregated school system. The U.S. Court of Appeals for the Ninth Circuit upheld Seattle's desegregation plan, stating that the plan "carries no racial stigma and says nothing at all about that individual's aptitude."

The program does use race as a criterion, but only to ensure that the population of each public school roughly reflects the city's racial composition." Many parents in the Seattle case appealed to the U.S. Supreme Court, claiming that any enrollment policy that considers a student's race, even if the intention is to achieve racial diversity, is unconstitutional. The challengers were backed by President George W. Bush's administration, which stated in a court brief that "the solution to addressing racial imbalance in communities . . . is not to adopt race-conscious measures." In addition, parents and their lawyers argued that such an approach was counter to the 1954 ruling in *Brown v. Board of Education* that struck down racial segregation in schools.

Both cases presented the same underlying legal question. Should a public school system be able to choose to classify students by race and rely upon that classification in making school assignments?

U.S. Supreme Court Ruling

In late June 2007, the Supreme Court granted a decision on both the *Parents Involved in Community Schools v. Seattle School District No. 1* and the *Meredith v. Jefferson County Board of Education* cases. The Court found both Jefferson County and Seattle's enrollment plans unconstitutional under the equal protection clause of the Fourteenth Amendment, citing the *Brown II* (1955) decision by stating, "The way to achieve a system of determining admission to the public schools on a nonracial basis is to stop assigning students on a racial basis." Chief Justice John Roberts wrote in the plurality opinion that "the way to stop discrimination on the basis of race is to stop discriminating on the basis of race."

Four years prior to this decision, former Justice Sandra Day O'Connor cast the deciding vote in a 5–4 decision that upheld the use of race to achieve student diversity at the University of Michigan Law School. After Justice O'Connor's retirement, she was replaced by a more conservative Justice, Samuel Alito, and the High Court experienced a shift in its race-based enrollment jurisprudence.

The Court acknowledged that it had previously held that racial diversity can be a compelling government interest in university admissions, but unlike the cases pertaining to higher education,

Jefferson County's plan involved no individualized consideration of students and it employed a very limited notion of diversity with its "Black" and "Other" classification system. The Court ruled that in the Jefferson and Seattle cases, race was not considered as part of a broader effort to achieve "exposure to widely diverse people, culture, ideas, and viewpoints." The Court stated that for some students, race was the determinative standing alone. Race was not simply one factor weighed with others in reaching a decision; instead it was the factor. The Court referred to the University of Michigan undergraduate plan struck down in an earlier case (Gratz), stating that the Jefferson County racial balancing plan did not provide for a meaningful individualized review of applicants but instead relied on racial classifications in a "non-individualized, mechanical" manner. Jefferson County's goal of preventing de facto segregation did not meet the Court's standards for a compelling state interest. The plans also lacked the narrow tailoring that is necessary for race-conscious programs. Narrow tailoring requires "serious, good faith consideration of workable race-neutral alternatives." Both districts failed to illustrate that other strategies that did not include explicit racial classification had been considered in efforts to achieve their stated goals. Furthermore, the Court stated that racial imbalance might result from past de jure segregation (segregation by law) as well as private decisions including voluntary housing choices. Therefore, the Court held that racial imbalance is not segregation and is not unconstitutional. The Court found that Jefferson County's enrollment plan was targeted toward demographic goals and not toward any demonstrable educational benefit from racial diversity. In announcing the ruling, Chief Justice Roberts challenged public school administrators to find a way to remain faithful to the promise of racially integrated schools under *Brown v. Board of Education* but to do so without paying inordinate attention to the racial or ethnic background of the students.

While some praised the Court's decision on the basis that there was no need for the race-based enrollment plans because the schools were already diverse, others were outraged by it, claiming that it is an attempt to maintain de facto segregation. Nonetheless, as a result of this decision, it has been declared unconstitutional for school districts

to implement enrollment plans that consider race as a determining factor for student placement.

UNITED STATES V. MONTGOMERY COUNTY BOARD OF EDUCATION

This case is specifically concerned with the desegregation of faculty and staff in public schools and the use of mathematical formulas to achieve that goal. In *United States v. Montgomery County*

Board of Education (1969), the U.S. Supreme Court unanimously upheld an approach, ordered by the local district court, that tied faculty desegregation goals to a school system's Black-White faculty ratio and set forth specific numerical requirements in achieving those goals. This entry discusses the historical context of the case, the facts of the case, the Supreme Court's decision, and the impact of the ruling.

Historical Context

On the eve of the U.S. Supreme Court's decision in *Brown v. Board of Education, Topeka, Kansas* (1954), with the racial desegregation of public education hanging in the balance, the future involvement of African American teachers and principals in the public school system was also at stake. For the previous 90 years, since emancipation, African Americans in the South had pinned energy and hope on their schools and entrusted their young to African American teachers and school administrators. African American educators were often among the best and brightest of their communities; they were in many cases more qualified and competent than their White counterparts, in those pre-*Brown* years. The very circumstance of segregation, it is said, allowed for and engendered a close relationship between the African American community and its schools, and empathic and respectful relationships between African American educators and their students and their students' families. African American teachers and principals occupied an esteemed position within the African American community and brought inspiration and motivation to African American children.

A critical component of de jure segregation was the complete racial alignment of schools and educators: African American teachers and administrators were exclusively employed at African American schools, and schools attended by White children were staffed by White teachers and administrators. Schools were, quite simply, racially identifiable by the race of their principals and teachers.

With *Brown I* in 1954, segregation of students by race in the public schools was declared unconstitutional. Subsequently, the Supreme Court enunciated the manner for achieving the segregation of schools. Under *Brown II*, local school systems

were charged with making changes “at the earliest practicable date” and with “all deliberate speed”; local courts were charged with resolving any problems of delay and with assuring that school authorities made a prompt and reasonable start toward full compliance.

Ten years had gone by in Montgomery County, Alabama, since the declaration of *Brown*, and the racial composition of the schools there had not changed. The Montgomery County public schools continued to be operated as a dual system, separate for African American and White students and teachers, much the same as they had been before the *Brown* decision; the school authorities had taken no action whatsoever to embark on desegregation. In fact, the state government had made great efforts to defy *Brown* and maintain segregation. Through policy, practice, and custom, the Montgomery County Board of Education operated a dual school system, with one set of schools attended exclusively by African American students and staffed only by African American teachers, and the other set of schools attended exclusively by White students and staffed only by White teachers.

Facts of the Case

Arlam Carr Jr. was an eighth grader at one of the all-African American schools in Montgomery, Alabama, when he became the lead plaintiff in the case that was brought to integrate the Montgomery County schools. He had wanted to attend Montgomery’s Sidney Lanier High School since he was very young, before he understood it to be a public school that only Whites could attend. Both of his parents took part in voter registration campaigns and worked as polling officials in Montgomery, known as the birthplace of the civil rights movement. Johnnie Carr, the mother of Arlam Jr. and a close friend and former schoolmate of Rosa Parks, had been a founder of the Montgomery Improvement Association, which was formed in 1955 to organize the Montgomery bus boycott and continued through the years to work for equality, jobs, and voter registration for African Americans.

Fred Gray, the Alabama civil rights lawyer who had represented Rosa Parks and served as local counsel for the NAACP Legal Defense Fund on the Montgomery bus boycott, had pledged at the outset

of his legal career to target and destroy segregation. By 1963, not a single public school in Alabama had begun desegregation. With the Carrs as plaintiffs, Fred Gray challenged the utter failure—and the concerted resistance—of the Montgomery County school system in federal court. Thus began the long-term involvement of the district court in the desegregation of the local school system.

The District Court and the Appeals Court Rulings

In its initial 1964 decision in this case, the district court ordered that certain grades begin integration of students under a freedom-of-choice plan put forth by the school district (*Carr v. Montgomery County Board of Education*, 1964). This order, however, did not address faculty integration. Within two years, upon a determination that the school district had continued to fail in its duty to eliminate the dual system, the court in *Carr v. Montgomery County Board of Education* (1966) issued a more formal and comprehensive plan for desegregation, requiring affirmative steps—though no specific numeric goals—toward faculty and staff desegregation, ordered to begin in the 1966–1967 school year.

In the summer of 1967, the court entered a new decree requiring faculty desegregation. By 1968, however, even though the district court had been monitoring the school system for nearly 5 years, little progress had been made in Montgomery County. In fact, upon entry of the 1967 decree for faculty desegregation, 75 newly hired teachers were assigned or transferred to schools in which their race was in the majority. Only 32 teachers—out of 550 African American teachers and 815 White teachers in the school district—were teaching in schools where their race was in the minority; moreover, most of those were within the City of Montgomery and in high schools, leaving the dual system intact in the schools outside of the city and in almost all elementary schools throughout the county. All six African American teachers hired in the 1967–1968 school year had been assigned to African American schools, and 20 of the 26 White new hires had been assigned to White schools. Placement of student and substitute teachers followed the same racial pattern.

New Requirements

In 1968, Judge Frank Johnson of the district court imposed several requirements for desegregation on the Montgomery County school system (*Carr v. Montgomery County Board of Education*). He instituted guidelines to ensure that construction of new schools or additions to existing schools did not perpetuate segregation, that the transportation policies and practices not perpetuate segregation, and that the school district eliminate the impression that particular new schools were primarily for White students.

Notably, the 1968 order instituted stringent and specific numerical provisions for faculty and staff desegregation, in light of the inadequate progress achieved by earlier approaches. The goal, as enunciated in *Carr*, was for each school in the Montgomery County School District to have substantially the same ratio of White-to-Black faculty as the ratio throughout the system, and county-wide, the ratio was three White faculty for every two African American faculty. Eventually, full compliance, according to this order, would be achieved when this 2-out-of-5 proportion was mirrored in each school; for the immediate school year, a lesser proportion would be required as an initial step toward full compliance. Judge Johnson, in his 1968 order, established the following requirements: (a) Schools with less than 12 teachers had to have at least one full-time teacher whose race was different from the majority race of teachers at that school, and (b) schools with 12 or more teachers had to have at least 1 of every 6 faculty and staff members be of different race from the majority faculty and staff ratio at that school.

On appeal by the school system, the Fifth Circuit disagreed with what they regarded as rigid, inflexible requirements of the local court's 1968 order. The court of appeals, even as it recognized both the intolerable delay by Montgomery County in student desegregation and the county's failure to comply with earlier requirements for faculty desegregation, rejected the "fixed mathematical ratios" and softened the district court's commands. Thus, in *Montgomery County v. Carr* (1968), the order for faculty desegregation was modified, such that (a) for the 1968–1969 school year, the court should require only "substantially or approximately" the 5-to-1 ratio it had enunciated and (b) beyond the

1968–1969 school year, any numerical ratio should be eliminated as a requirement, and instead there must be "a good faith and effective effort" toward faculty and staff desegregation.

U.S. Supreme Court Ruling

The U.S. Supreme Court rejected the Fifth Circuit's modifications and unanimously upheld the local court order, finding it to be a reasonable plan for desegregation and not objectionable merely because it laid out fixed mathematical ratios (*United States v. Montgomery County Board of Education*, 1969). This case represented a milestone in the post-*Brown* evolution of desegregation: unspecified parameters for improvement and indefinite plans centered on good faith were recognized here as not sufficient for achieving the unitary school systems required by *Brown*. In its upholding of the district court order, the Supreme Court comported with the position (expressed by the Chief Justice of the Fifth Circuit Court of Appeals on dissent) that "specifics" were necessary for local courts to succeed in compelling faculty desegregation. *U.S. v. Montgomery* thus became a landmark case for tying faculty desegregation goals to a district's Black–White faculty ratio and for setting forth specific numerical requirements in achieving those goals.

Impact of the Ruling

The immediate result of *Carr v. Montgomery County*, beginning in September 1965, was the student desegregation of Montgomery County schools. Arlam Carr Jr. and others were part of a group that integrated Sidney Lanier High School in Montgomery. Arlam Carr Jr. was a senior there when Dr. Martin Luther King Jr. was assassinated; when he arrived at school the following morning, he insisted that the U.S. flag be flown at half-staff, as had been directed by President Lyndon B. Johnson.

The participants in the Montgomery desegregation lawsuit faced hardship during and after their quest. The Carrs faced obscene and threatening phone calls and feared that their home would fall victim to the bombings that plagued Montgomery at that time. The African American students who integrated the White Montgomery schools were ostracized and at times harassed by White students. The district court author of the Montgomery

desegregation order, Judge Frank M. Johnson, was denounced and threatened as well; neighbors burned a cross in his front yard, his wife and children were harassed, and his mother's house was bombed by members of the Ku Klux Klan.

Despite the best intentions of this case and others that required faculty and staff desegregation, *Brown* and its progeny are regarded by many as having decimated the ranks of African American teachers and principals who suffered job loss or demotion with desegregation. By extension, similar negative effects were experienced by the students who were taught by hostile White teachers instead of the many African American teachers and principals who were forced out of the school system. A critical aspect of the *Carr* holding is that faculty and staff desegregation of schools hinged on the racial composition of the districts at large but did not require districts to alter that composition. In other words, *Carr* did not compel the hiring or retention of African American educators; it only compelled their distribution, to whatever extent they were employed by a district, throughout the district.

Meanwhile, out of the dictate of *Brown* arose, eventually, the closing and consolidation of schools as well as the fervent resistance of previously White schools to employ African American teachers. These powerful and pervasive trends, in turn, assured over time that large numbers of African American teachers and administrators would lose their positions and that new opportunities in the field of education would be correspondingly scarce.

The premise of the *Carr* order was simple and straightforward: the racial composition of faculty and staff at each school within a district should mirror the overall racial composition of faculty and staff for that district. Such an allocation of employees signals the racial neutrality of the school system. Yet 50 years or so after *Brown*, and nearly 40 years since the U.S. Supreme Court approved specific, mathematical requirements for the abatement of faculty and staff segregation in Montgomery County, many public schools across the United States continued to be identifiable, racially, by the race of their teachers. In numerous cases of school desegregation involving remedial decrees, district courts have had to address a failure to have a racially neutral distribution of teachers in the school districts.

Moreover, in the schools in which one race is overrepresented on the faculty far beyond the

racial composition of the schools' districts, the racial overrepresentation invariably aligns with the racial makeup of the student body: schools that are found in desegregation proceedings to have greatly disproportionate (for their district) numbers of African American teachers are always those in which the student population is predominantly African American. There may be an argument, in fact, in favor of a high representation of African American teachers in schools with a high African American student population, but the law requires faculty desegregation. Despite this standing requirement, though, the racial identifiability of schools by their faculty persists.

Aside from the key point of *U.S. v. Montgomery*—that faculty desegregation goals would be tied to a district's Black-White faculty ratio by setting forth specific numerical requirements in achieving those goals—the *Carr* case, its predecessor case in the district court, was significant as well for its structural approach to desegregation. Judge Johnson's 1968 order established an extensive and ongoing process by which school officials, the U.S. Justice Department, citizens, and the local federal judiciary participated actively in fashioning remedial plans and alleviating the unconstitutional segregation of schools.

UNITED STATES V. WALLACE

In *United States v. Wallace* (1963), Alabama courts revisited an earlier U.S. Supreme Court decision saying that the University of Alabama could not deny admission to students on the basis of race, even when based on preserving social order. The earlier case, *Lucy et al. v. Adams* (1955), dealt with the dean of admissions barring admission of any African American to the university. On July 1, 1955, an Alabama district court judge entered an order enjoining that action and precluding the dean of admissions from denying to African Americans, the right to enroll and pursue courses of study on account of their race. The Fifth Circuit Appeals Court affirmed but suspended the lower court order pending an appeal to the U.S. Supreme Court. The U.S. Supreme Court did quickly affirm and the *Lucy v. Adams* injunction was reinstated. However, as it was 4 days after the deadline for fall enrollment at the university, the African American students were denied admission due to late registration. This ruling, effectively denying them admission for reasons other than race or color, was upheld by the district court. Subsequently, at the next test, the university sought to refuse admission to African American students on the grounds that they would cause racial unrest. The court, however, stood by its original order.

Facts of the Case

Generally, racial segregation took two forms: mandated by law or imposed through social norms. It was maintained by means ranging from discrimination in hiring and in the rental and sale

of housing to certain races to vigilante violence such as lynching. Legal segregation in the United States was required and came with antimiscegenation laws—laws prohibiting interracial marriage. But such laws contradicted the very premise this country was built upon—that is, freedom and equality for all.

Unfortunately, the legitimacy of such laws was upheld by the U.S. Supreme Court in the case of *Plessy v. Ferguson*, an opinion issued in 1896. The Court in *Plessy* introduced the phrase “separate but equal.” Thurgood Marshall in conjunction with the National Association for the Advancement of Colored People (NAACP) challenged this phrase in the case of *Brown v. Board of Education, Topeka, Kansas* (1954). In *Brown*, the Court examined the constitutionality of *Plessy* and voted to overturn its previous ruling. Chief Justice Earl Warren, writing a unanimous opinion, stated that the doctrine of “separate but equal” has no place in the area of public education. Otherwise stated, the Court ruled that separate educational facilities are inherently unequal. Several years later, however, a similar issue was before the judicial system again.

After the 1955 decision in *Lucy v. Adams*, the Board of Trustees of the University of Alabama sought leave to intervene in the case in order to have the district court’s 1951 permanent injunction lifted. The members of the board revealed to the court that two African American citizens of the state of Alabama had again applied for enrollment in the university and, although qualified, were not admitted because allowing them to enroll would cause racial unrest in light of the prevailing social climate. Nevertheless, the Court found that its original order, which eliminated racial segregation in public education, was still in full force and effect.

There were two *United States v. Wallace* cases, both decided in 1963. The case at hand was specifically against Governor Wallace and the other was against Alabama officials. *United States v. Wallace* (1963a) against Wallace was decided first and followed a finding by the same district court judge Grooms who ruled in *Adams* that African Americans with pending applications for enrollment in the university could ask the court to enforce the order. Governor Wallace was ordered to not interfere with federal orders providing for the desegregation of the University of Alabama. In

the second case, *United States v. Wallace* (1963b), District Court Judge Seybourn H. Lynne issued a preliminary injunction precluding state officials from acting against desegregation efforts.

Notwithstanding the court's ruling in *Adams*, George C. Wallace, governor of Alabama, was determined to dissuade Negroes from seeking admission to the university. The governor stated and reiterated publicly that he would be present to bar the entrance of any Negro who attempted to enroll at the University of Alabama. Further, he attempted to ignore the May 21, 1963, order entered by Judge H. Hobart Grooms, the *Lucy v. Adams* judge, while pledging that law and order would be maintained. Clearly, Wallace's approach was at best preposterous; yet, his strategy deterred many African Americans from seeking admission out of fear. This is what prompted the federal government to file suit against the governor. Fortunately, the district court properly noted that the "governor of a sovereign state has no authority to obstruct or prevent the execution of the lawful orders of a court of the United States."

Impact of the Ruling

Few can argue that separating Black applicants from other applicants solely because of race does not generate feelings of inferiority. In fact, studies once showed that segregated education had a negative psychological effect upon Black schoolchildren. Although some have doubted the legitimacy of the studies, there is little doubt that racial segregation in schools denied Blacks the same opportunities as their White counterparts. This is precisely what the judiciary sought to eliminate, and because of the decisions issued in cases such as *Adams* and *Wallace*, the United States made a necessary leap toward equality for all. Public education was only the precursor to many other rights that Blacks were to gain in the near future.

African Americans were successful in challenging key rights such as public education—a right that, if not afforded, could severely debilitate their race. As a result, the concept of law and order was somewhat restored. The State of Alabama had indirectly prompted a movement toward restoring the liberties the United States sought to offer all races.

The very essence of a republican form of government embraces the notion that when a court of

law has rendered a final judgment, all persons affected are obliged to obey it. In this vein, because all persons are affected, all should effectively be equal. A law that once permitted such segregation and thus disorder was remedied by the bravery of many African Americans and the judicial system. Perhaps, this is one of the few cases where a judge has sought his or her own prayer—that is, "that all of our people, in keeping with our finest traditions, will join in the resolution that law and order will be maintained" in Alabama.

UNIVERSITY OF MARYLAND V. MURRAY

In *University of Maryland v. Murray* (1936), a young Black man sought legal intervention so that he could be admitted to the University of Maryland Law School. The circuit court ordered the school to admit Murray, in the absence of any suitable and segregated alternative. The university lost its appeal. Although the precedent was not national in scope, the victory inspired National Association for the Advancement of Colored People (NAACP) attorneys to use this successful strategy, challenging facilities that were separate but not equal in other cases. This entry reviews the historical context of the case, the facts of the case, and the impact of the ruling.

Historical Context

In the decades following the U.S. Supreme Court's 1896 decision in *Plessy v. Ferguson*, institutions in southern states followed the Court's "separate-but-equal" doctrine. With this interpretation of

the equal protection clause of the Fourteenth Amendment to the U.S. Constitution, Jim Crow reigned. In nearly every facet of public life—particularly in public accommodations such as railcars, buses, restrooms, and hotels—segregation was the rule.

Many people were opposed to segregation. Yet others took a more pragmatic if not defeatist approach, being less concerned with the very fact of segregation and more concerned with the deep and persistent inequalities evident in the lives of Black people in the South. Still others were concerned with both sides of the equation. Following the plan mapped out by Nathan Margold, the NAACP began to pursue equalization cases, attacking not the fact of segregation but the lack of true equality between and among segregated arrangements. In one sense, these cases were designed to deliver on the “equal” part of the “separate-but-equal” doctrine by bringing the resources provided to Blacks into line with those provided to Whites. But many people also hoped that the strategy would cripple segregation as applied, making total segregation unfeasible for states to implement. These cases were often popular among Black professionals, such as teachers, who (despite having similar training and credentials) were routinely paid less than White teachers.

Separate and unequal facilities were readily apparent in the realm of public education, where separate schools were maintained for the education of Black students. States routinely spent far more money per child to educate White students than Black students. And in higher education, some states preferred to pay the educational expenses of Black students to attend schools out of state rather than integrate institutions within the state.

The NAACP and a young Thurgood Marshall, armed with the Margold strategy, favored higher-education cases, based upon the belief that the disparities, particularly for graduate and professional programs such as law schools, would resonate more readily with judges.

Facts of the Case

Donald Gaines Murray, a young Black man from a prominent Baltimore family, was a qualified candidate for admission to the University of Maryland Law School—the same school that

denied admission to Thurgood Marshall before he trained at the Howard Law School. Pursuant to Maryland’s segregation law, Murray was denied admission to the University of Maryland Law School and was instead referred to other state-run institutions set up for Blacks as well as to the state program of providing scholarships to Black students to attend out-of-state schools.

Murray sought admission to the University of Maryland Law School in 1935 but was denied because of his race under Maryland’s segregation laws. The civil rights lawyer, Belford Lawson, convinced Howard Law School Dean Charles Hamilton Houston to have Thurgood Marshall file this landmark case on behalf of the well-qualified plaintiff, Donald Gaines Murray. The rejection letter he received from university president Raymond A. Pearson stated plainly, “The University of Maryland does not admit Negro students and your application is accordingly rejected.” The State of Maryland did not operate a separate law school for Black students. Thus, there was no appropriate segregated placement for Murray. And the state’s scholarship program for out-of-state education of Black students was not funded and made available to Murray until after litigation ensued.

The case was filed in Maryland Circuit Court in Baltimore. Houston and Marshall argued that Maryland violated Murray’s constitutional rights and *Plessy*’s “separate-but-equal doctrine” by denying him admission to the University of Maryland Law School and failing to provide a suitable alternative at a segregated Black institution—one equal to the opportunities offered at the University of Maryland. Houston exploited the dictum articulated by the U.S. Supreme Court in *Gong Lum v. Rice* (1927), a Mississippi case in which the Court upheld school desegregation but noted that the case might have been decided differently had there been no school available in the plaintiff’s neighborhood, a situation analogous to the one presented in the Murray case.

Houston opened his case in chief by calling as a witness university president Raymond Pearson. In a display that must have been embarrassing to Pearson, Houston questioned the university president intensely, forcing him to admit that members of other non-White racial groups were admitted

by the university and that the school had not offered Murray any funds to attend a school out of state.

The evidence and arguments were persuasive to the judge, who seemed sympathetic from the bench during the trial. The judge issued a writ of mandamus ordering President Pearson to admit Murray to the law school. The university appealed the lower court's decision to the court of appeals, where it was unanimously affirmed the following year.

Impact of the Ruling

Pearson v. Murray (1936) was a state court decision and was not appealed to the U.S. Supreme Court. Although Houston and Marshall appealed in the state's highest court, the decision did not constitute a binding precedent throughout the country. It was significant for a number of reasons. First, it proved that the Margold strategy, when pursued under the right set of facts and with an ideal plaintiff, would be effective in undermining segregated education as applied, in arrangements that were separate and unequal to those afforded Whites. This middle-of-the-road approach to attacking segregated institutions forced integration, albeit piecemeal, in certain higher-education institutions and ratcheted up the costs of segregation for those states that continued to pursue it in the higher-education arena. The victory validated the strategy of addressing segregation in law schools and other graduate and professional programs—a strategy viewed as less incendiary than focusing on K–12 institutions and colleges.

The victory also emboldened the NAACP and its lawyers, setting in motion efforts that led to important victories in the federal courts in cases such as *Missouri ex rel. Gaines v. Canada* (1938); *Sipuel v. Board of Regents of Univ. of Oklahoma* (1948); *McLaurin v. Oklahoma State Regents* (1950); and *Sweatt v. Painter* (1950). The victory served as sweet, cold revenge for Thurgood Marshall, who himself had been denied admission to the same law school. The arguments in the *Murray* case laid a particularly important foundation for the *Missouri* case, in which the U.S. Supreme Court outlawed out-of-state scholarships for Black students, requiring (at minimum) that states must provide in-state education in specific graduate programs to Blacks,

either at segregated in-state schools or at the White institutions within the state.

URBAN EDUCATION

What is urban education? The connotation and denotation of the word *urban* can be quite different, especially when metropolitan areas with large school systems are called “urban districts.” In this entry, the concepts of *urban* and *urban education* are defined and described to provide readers with background knowledge of these social identifiers and their connections to African American communities. The entry covers many of the issues that plague urban districts and how these challenges have been addressed. It concludes with a brief overview of more recent reforms targeted to meet the needs of African American students in urban areas.

Defining Terms

The U.S. Census Bureau defines *urban* as an “area” or “cluster” that consists of a large central place and adjacent densely settled census blocks that together have a total population of at least 2,500 for urban clusters, or at least 50,000 for urbanized areas. An urban area may be defined simply as a nonrural area, or as a densely populated area with a central downtown location for commerce. Suburbs and nonagricultural areas may be considered urban.

Although there is no single definition of urban in educational scholarship, several characteristics

are attached to the way scholars discuss the term *urban* or *urban education*. As cities have grown over the past century, *urban* has taken on a more social meaning that goes beyond the size of a population. When sociologists and anthropologists discuss *urban*, they assume a host of social, political, and economic contexts that are not indicative of rural or suburban areas.

Urban communities host numerous cultural, social, academic, and economic resources and racial and language diversity that can be sustained only in large metropolitan areas. Often, someone who is “urbane” claims a number of cultural and social experiences and a body of knowledge that other people who have not had such opportunities may envy. Conversely, urban areas are known for dense populations, high crime, racial and economic segregation, large school systems, diverse job and career opportunities, and unwieldy public government infrastructures. These elements separate urban areas from suburban and rural areas because the large populations create a unique set of political, social, economic, and environmental amusements and challenges that impact a multitude of diverse stakeholders in these spaces.

Issues in Urban Districts

The urban school district is one example of a large bureaucratic structure that has undergone a series of transformations due to the often oppositional needs of the diverse populations that live in close proximity in metropolitan areas. At the beginning of the 20th century, most African Americans lived in rural areas of the United States. During the 1950s, African Americans migrated to southern and northern metropolitan areas in search of employment, new career opportunities, and education. In some cities, such as Milwaukee, Wisconsin, the African American student population rose more than 300% during the 1950s. Additionally, the migrating African American population and subsequent racial and ethnic populations were comprised mainly of low-income wage earners who needed new skills to qualify for the jobs in the industrialized metropolitan areas.

Once held in high esteem for their ample resources and innovative practices, the significant socioeconomic and racial-ethnic demographic changes and quick expansion of school districts in

large U.S. cities led to the rise of the term *urban education* and the shift to viewing these districts as deficient and problematic. Urban education, in part, is defined by large bureaucratic systems of governance, racial-ethnic diversity, extreme differences in students’ socioeconomic levels and housing conditions, and centralized resources.

Urban school districts consistently struggle to provide equal educational experiences for all the children in the district. Some reasons for this struggle are inadequate funding, distribution of monies, diversity of needs (academic levels, socioeconomic levels, multiple languages, social services), and teacher quality. A recent study funded by the Foundation for Child Development in conjunction with the U.S. Urban Institute found that nearly 70% of the nation’s Limited English Proficiency (LEP) students are enrolled in 10% of its schools. These “High-LEP” schools are predominantly located in urban areas. This means that urban schools are more likely to serve students with areas of greater and more diverse needs than more homogenous, English-speaking populations of students in the suburbs or rural areas of the United States.

Urban districts often become the battleground for political infighting among various groups of citizens and stakeholders, as well as the outlier in political discussions at the level of the state. These battles often concern property tax increases, implementation of new reforms, standards, and assessments, program cuts, federal and state mandates, and building closures. Often, urban school districts comprise a significant portion of a state’s citizens who are less than 18 years of age and the future workforce; these factors must be balanced with the needs of the rest of the state’s school districts. Within districts, stakeholders often disagree on the roles schools play in the individual lives of students, the political and social mobility of groups, and the connection to the future state or U.S. economy. These disagreements lead to bitter struggles to gain or maintain control of district governance boards and superintendents.

Urban districts provide an array of schooling options that are not found in smaller cities and rural areas. In urban districts, there are often magnet schools that focus on particular aspects of the curriculum and educational goals, vocational programs, open enrollment opportunities across

Table 1 Ten Largest U.S. Places in Total Population and in Black or African American Population

districts, corporate sponsorship and community collaborations, and other educational and cultural resources that link with individual schools and districts to provide innovative programs for children in public schools.

Urban districts are particularly important to African Americans because of the high numbers of African Americans living in urban areas. In 2000, the Census Bureau documented the 10 cities with more than 100,000 people with the highest number of African Americans (see Table 1).

According to the U.S. Census 2000, nearly 88% of all African Americans live in urban or metropolitan areas. Although they may not comprise a city's majority population, the high number of African Americans living in urban areas often makes people connect urban spaces with African Americans and racial diversity. The shift from the United States as an agricultural nation to an industrialized nation with large cities is due, in part, to the migration of African Americans to metropolitan areas. Historically, the moves to racially desegregate large urban school districts have been characterized as a political binary between African American families asking for educational equity and White families trying to maintain homogenous White schools.

Desegregation in Urban Cities

Although three decades of partially desegregated schools positively affected the experiences of thousands of students, urban areas have remained highly segregated by neighborhood. The segregation of

cities, as well as suburbs, was solidified after World War II, when the Federal Housing Association enforced and encouraged segregated housing policies for White and Black soldiers seeking to buy new homes with their GI Bill funds. Because of the lack of jobs, the large migration of African Americans from the South to the North, and overt and subvert racism in urban areas, African Americans quickly became highly segregated in poor, working-class, and middle-class enclaves in urban areas. During this time, the government constructed tenements for low-income housing, and the redlining of neighborhoods with high or rising populations of African American families reinforced economic and racial segregation in urban areas. This separation, and the lack of political power held by African Americans in urban areas, led to unequal education funding and resource allocations in urban school districts.

Since the 1950s, African Americans have looked to the U.S. district, state, and federal court systems to help them acquire equity and equality in education. In many cases, the federal plans and challenges to the court ordered reforms continued for decades and cost taxpayers millions of dollars. *Brown v. Board of Education, Topeka, Kansas* (1954) is possibly the most famous example of civic activism concerning the constitutional rights of African American children.

As the United States continues to reflect on the products of *Brown v. Board of Education*, it is important to recognize that this decision and other federal court decisions concerning desegregation were acted upon in various ways by northern and

southern states and produced differing policy results. Many northern cities in the United States share similar patterns, events, and conflicts as part of their desegregation processes. Parents in northern cities such as Boston, Detroit, and Milwaukee fought for and against desegregation initiatives for more than 50 years. African Americans repeatedly insisted that they wanted their neighborhood schools to be reformed and given equal resources so that their children received a fair amount of district monies, veteran teachers, and competent staff.

The *Brown* decisions of 1954 and 1955 had the fastest and greatest effect on southern states, where overt segregation could be easily identified. The complexities of segregated housing and redline districting in the North allowed northern cities to remain inconspicuous for much longer periods before school desegregation became a major court issue. The tenuous line between de jure segregation, that which is imposed by law, and de facto segregation, that which is created by social practices and individual choices, made it difficult for northern urban parents to prove intended harm and pressure districts.

In southern districts, de jure segregation was most often the case and was more easily identified by the courts. In many southern cities, African Americans and Whites lived in close proximity to one another, often with the White and Black schools very close together. African American and White students attended their designated schools, regardless of neighborhood proximity to their homes, possibly passing the other school on their way to their school. However, in the North, due to intense housing segregation, African American parents had a difficult time advocating against neighborhood schools that were highly segregated. Activist in the North had to show willful attempts to maintain neighborhood segregation and unequal interdistrict resource allocation in order to win relief from the courts.

In order to please multiple stakeholders in urban districts, urban school boards attempted several models of desegregation. Many cities created magnet schools or special programs that claimed particular academic orientations and selected students through a special process. Other districts bused African American students to White schools and closed a significant number of African American schools, causing a major loss of jobs and leadership

for African American communities. Generally speaking, curriculum changes, a shift in resources, and more money poured into African American schools were packaged into desegregation reforms.

Urban Education Today

At the turn of the 20th century, many of these desegregation reforms have been rolled back and eliminated. In the 1960s and 1970s, urban schools boasted, or lamented, a level of racial, cultural, and language diversity that was previously unknown. Today, little of the racial diversity remains in single schools, but multiple types of diversity can be claimed as a point of distinction for urban schools.

Other school reforms have replaced the desegregation reforms of the 1960s and 1970s. Presented by various political factions in the United States, these reforms are highly controversial. Reforms such as choice and vouchers allow private religious schools to receive public monies that were previously part of the district's funding. Choice schools are independent schools, religious or sectarian, that are not bound by the same state or district policies as public schools. For example, teachers do not need to be certified to teach in these schools, and the schools may not be compelled to share their statewide testing results.

Similarly, charter schools, which are considered public institutions, have more leeway with teacher hiring and public accountability. Charter schools are constructed differently in each state, and they are often eligible for federal and state education grants. For example, in Illinois, the charter schools must be tied to the primary local school district. In Wisconsin, charter schools can be associated with the local school district, a university, or the city itself. Depending on the chosen association, these charter schools differ in accountability criteria to the state.

Large urban school districts such as San Diego, Chicago, Philadelphia, and Charlotte have implemented districtwide educational reforms, as well as smaller individual or small cluster instructional programs to increase student learning outcomes. In an attempt to maintain neighborhood schools, districts have created smaller school teams composed of administrators, teachers, parents, and sometimes students to make curricular decisions that are tailored toward the needs of the students in the

neighborhood. The reinvention of the neighborhood school is an acknowledgement of the failure to systematically racially desegregate schools and neighborhoods, and in many ways a move back to the separate-but-equal doctrine found in the *Plessy v. Ferguson* verdict that was overturned with the *Brown* decision.

Researchers concede that, ideally, most parents would prefer to place their children in strong neighborhood schools that reflect their ties to family and particular communities. Urban districts struggle to find solutions to educational dilemmas that meet the needs of the diverse groups of stakeholders and serve the workforce needs of the state. Given the political terrain of urban districts, school boards continue to search for new reforms, curriculum, and pedagogical practices that will serve their constituents.

VOTING RIGHTS ACT OF 1965

On August 6, 1965, Congress passed the Voting Rights Act of 1965, and President Lyndon B. Johnson signed the bill. The primary purpose of the act was to allow the U.S. Justice Department to take direct action to protect the right of African Americans to vote. Many compare the role of the federal government in securing the rights of African Americans in the South to the period of Reconstruction from 1867 to 1877. Not in 100 years had the federal government made integral efforts to protect the rights of African Americans.

Congress passed the bill, and President Johnson signed the Voting Rights Act of 1965 to eliminate racial discrimination in the U.S. electoral process. The act was intended to remove obstacles to African American registration and voting with the enforcement of the Justice Department. And, in fact, the Voting Rights Act of 1965 has increased African American voter registration and participation in the electoral process substantially. This entry looks at the record of African American voting rights, then discusses the origins of the bill and its contents.

Early Enfranchisement History

Prior to the Civil War, free African American men were disenfranchised in all but six northern states, and African American women could not vote anywhere in the United States until 1920. After the Civil War, even during the early years of Reconstruction, African Americans remained mostly disenfranchised in the North, and suffrage was severely restricted in the South, even though Congress had passed the Fifteenth Amendment to the U.S. Constitution, which guaranteed African American men the right to vote.

The protection of Union soldiers for African Americans in the South ended with the 1876 Hayes/Tilden compromise. After a close 1876 presidential election, Democrat Samuel Tilden agreed to relinquish the presidency to Republican Rutherford B. Hayes of Ohio if he agreed to remove federal troops from the South once in office. Cognizant of the waning national support of Republicans' progressive policies post-Reconstruction, Hayes agreed to the compromise. Hence, the successes of the Fifteenth Amendment were short-lived for African Americans in the South.

African Americans faced resistance in the form of the Ku Klux Klan and various local and state laws mandating deliberately restrictive voting requirements. Hindrances to voting for African Americans, such as literacy tests, grandfather clauses, all-White primaries, and poll taxes, lasted without major successful legal challenge until the mid-1900s.

The Fifteenth Amendment was in part made possible because of the Thirteenth and Fourteenth

Amendments that preceded it. The Thirteenth Amendment, ratified in 1865, abolished enslavement, opening the door for African Americans to begin to think of themselves as citizens. The Fourteenth Amendment, ratified in 1868, overturned a decision in *Dred Scott v. Sandford* in 1857 holding that African Americans were not citizens. The Fourteenth Amendment granted citizenship to all persons born in the United States, including African Americans, and provided equal protection under the law for all citizens.

The Struggle Begins

After a series of successful 20th-century legal cases, many brought by the National Association for the Advancement of Colored People (NAACP) and heard by the U.S. Supreme Court, African Americans began to make some inroads with the restrictive local and state laws placed on them since the aftermath of Reconstruction. For example, Congress passed three Civil Rights Acts in 1957, 1960, and 1964. Each one—and especially the Civil Rights Act of 1964—added teeth to the Fourteenth (1868) and Fifteenth (1870) Amendments, and in doing so supported and protected African American voting rights. The acts made no provision for enforcement, however.

Congress was encouraged to guarantee equal rights to African Americans by other groups in addition to the NAACP, such as the Congress of Racial Equality, the Student Nonviolent Coordinating Committee, and the Southern Christian Leadership Conference. These organizations were primarily activist protest groups that organized demonstrations, whereas the NAACP was geared toward the legal arena. Whether working together on collaborative events or organizing their own events, the groups were frequently met with violence and resistance by White citizens and police in many southern communities.

The sometimes violent resistance these groups endured was often portrayed via television, and this coverage focused the nation's and the world's attention on the civil rights movement. For example, the murder of voting rights activists in Philadelphia, Mississippi, and attacks on marchers crossing the Edmund Pettus Bridge in Selma, Alabama, in the Selma to Montgomery march

persuaded President Johnson to take action. Ignoring southern legislators' resistance to voting rights legislation, President Johnson, influenced by a commitment President John F. Kennedy had made prior to his assassination, issued a call for a strong voting rights law, and hearings began soon thereafter on the bill that would become the Voting Rights Act.

It is important to note that violence, in the form of the March on Selma, motivated Johnson to enact the bill. Johnson and the Congress thought that a voting rights act was needed because existing federal antidiscrimination laws did not provide sufficient enforcement of the Fifteenth Amendment. Significantly, the role of television, then, in conjunction with President Lyndon Johnson's actions, garnered the necessary political support for the Voting Rights Act of 1965.

What the Act Did

Scholars tend to agree that the major provisions of the act are found in Section 4 and Section 5. Section 4 designated certain states in the country in which voting discrimination had been widespread and flagrant through the use of restrictive codes such as literacy tests; Section 5 focused more on implementation of measures and prohibition of any changes in voting procedures in those states without "preclearance" from the attorney general or from the U.S. District Court for the District of Columbia. The act won a challenge in the Supreme Court in the 1966 case *South Carolina v. Katzenbach*, which said that the act's suspension of literacy tests and its preclearance provisions were constitutional.

After surviving conservative opposition, the act's impact began to be noticeable, especially on registration and voting efforts on behalf of African Americans. For example, in the South alone, African American voter registration increased from 29% of the voting-age population in 1964 to 52% in 3 years. White registration increased only 6 percentage points during the same period. In all of the targeted southern states—Alabama, Georgia, Louisiana, Mississippi, South Carolina, Virginia, portions of North Carolina, and eventually Texas—African American voter turnout in the 1964 and 1968 presidential elections increased, in some instances by as much as 20%.

New Challenges

While voting percentages among African Americans generally increased, vote dilution—the practice of diminishing the impact of the voting strength of minority groups—has taken many forms and in some cases continues to exist. For example, by reshaping political and in some cases school boundary lines, efforts have been made to maintain the primacy of Whites' voting power in school board elections and general elections.

While such tactics as redistricting are often challenged in the courts, success has not been consistent. Since 1965, for example, plaintiffs from minority groups have challenged vote dilution practices under Section 2 of the act. The proof required to establish a claim of vote dilution has changed several times during this period. In 1980, for instance, in *Mobile v. Bolden*, the Supreme Court held that, to establish a vote dilution violation under Section 2 of the act, or the Fourteenth or Fifteenth Amendments, plaintiffs were required to prove that officials maintained or adopted the challenged electoral devices with the intent to discriminate against voters from minority groups. These tests placed a high evidentiary burden on plaintiffs, as they had to probe the racial motives of lawmakers, public officials, and entire communities in order to prove discriminatory intent.

Recognizing the high burden of proof of discriminatory intent, in 1982, and in response to the Supreme Court's decision in *Bolden*, Congress amended Section 2 of the act. Congress replaced the discriminatory intent standard with a less stringent results-based test. With this weaker burden of proof, voting rights advocates in the courts increasingly prevailed as they were permitted to challenge electoral procedures that had the result only of denying equal opportunity to a minority group. With these favorable changes, African Americans began to experience greater participation in the political process and the legal authority to elect representatives of their choice in certain districts, or descriptive representation.

New Interpretations

The amended act did not survive without legal challenge, however. In *Thornburg v. Gingles*, in 1986, the Supreme Court held that any claim of vote dilution must be accompanied by an at-large,

multimember-district election procedure. Often referred to as the “*Gingles* test,” the Court held that the minority group seeking equal opportunity must be sufficiently large yet compact enough to constitute a majority in a single-member district, and the group must be politically cohesive. Finally, the White majority must vote as a block in any significant effort to defeat a minority group's choice of candidates. These additional provisions have been proven difficult to meet.

The Voting Rights Act of 1965, especially since the *Gingles* test, has been applied in vote dilution cases involving school board elections. Many such lower courts have indicated a preference for ward voting over multimember at-large school board elections, and as a result have viewed single-member districts as electoral devices that maximize the voting strength of minority groups. As a result of these consistent conservative opinions, school board election schematic systems have frequently been eliminated by the federal judiciary and in the process have stopped significantly short of creating any minority group right to proportional representation.

Thanks to the Voting Rights Act of 1965, African American citizens have achieved electoral success in elections for school boards, city councils, and state and national offices. Nevertheless, African American candidates are not elected in numbers that reflect the percentage of the African American population. Challenges to attaining a fair and equitable voice remain, especially in local politics. As an example, recent state and local laws mandating that voters present valid government-issued identification prior to voting may be a mechanism to prevent some African Americans from participating. Even given its shortcomings, however, the act has been viewed largely as a success by scholars and average citizens alike because it has helped to increase participation of minority groups in the electoral process generally.

VOUCHERS

The use of educational vouchers to fund public education is a controversial plan designed to improve both the quality of education and the safety of public schools. There is little debate about the fact that many urban public schools, populated with mostly African American students, suffer in terms of the quality of education these students receive. These schools are often unsafe as well. There have been numerous proposals to improve urban schools. The plan most often proposed is community control, in which members of the affected communities have a greater say in the management of public schools. There is still debate as to whether this approach has worked. Education vouchers represent an alternative strategy based on the idea of sharing control at the local level.

This proposal requires that educational funds follow the child to the school chosen by the parents. In this manner, the parent decides which school will give the child the best educational experience, and schools must compete for students. The result, it is claimed by proponents, would give African American parents more control over the

education of their children. It is also claimed that a voucher system would improve the quality of U.S. education in general and African American education in particular. Although publicly funded voucher programs now exist in jurisdictions across the United States, the number of students receiving such vouchers remains very small. For the 2006–2007 school year, fewer than 57,000 vouchers were granted for all programs combined. This entry looks at voucher programs' history, supporting arguments, and evidence of effectiveness.

Historical Background

Economist Milton Friedman, in 1955, published an article titled "The Role of Government in Education." In this article, he argued that while governmental funding of public education was justified, governmental administration of public education was ineffective and burdensome. He suggested that the best strategy for the United States' overall education administration and quality was to give parents vouchers that could be used at any school (public, private, or religious) the parents thought would give their children the best education. Funding for schooling would be provided either by monies being given directly to parents, monies given directly to public, private, and religious schools, or tax credits given to parents.

In this way, Friedman believed, school funding would be related to both parental choice and the quality of the schools. Parents could decide whether to send their children to public or private schools. Since public schools would not be guaranteed public funds, these schools would have to compete with private and religious schools for funding. This competition between public and private schools, it was argued, would provide an educational environment that would improve the general quality of education in the United States. Whether the vouchers were called school or educational vouchers, it was argued that free-market forces would best serve education in the United States.

Some professional educators hailed this position as needed educational reform. Nonetheless, this view of educational financing was not without its detractors. One of the major concerns with a vouchers system is that it takes needed funds from the public school coffers and transfers them to private and religious schools.

The idea of using vouchers to fund private education got a boost in 1983 with the publishing of the U.S. Department of Education's report, *A Nation at Risk: The Imperative for Educational Reform*. This report concluded that the U.S. education system was failing to provide the quality of education needed by U.S. citizens to compete with students from other countries. It stated that the education at all levels was mediocre at best. President Ronald Reagan responded to the report by claiming that U.S. education could be fixed by allowing school prayer, providing school vouchers, and abolishing the Department of Education.

Although subsequent reports—*A Nation Still at Risk* (1998) and *A Nation at Risk, Twenty Years Later* (2003)—showed some improvement in the quality of education in the United States, the idea that a voucher system of school funding would enhance the educational process in the United States remained a topic of debate. Proponents of vouchers have focused on the issues of governmental control and parental choice, whereas opponents have focused on the equality and politics of funding.

Supporting Arguments

The debate intensified in the mid- to late 1980s as the seeming failure of many urban schools to provide an adequate educational experience gave the proponents of vouchers a cause to rally poor urban parents. It was argued that the voucher system would give these parents the freedom to choose which schools their children attended and would force schools with low-quality teaching to compete for both students and funding. Vouchers were thus seen as a way to improve the education of poor urban children.

It was argued that parents in these communities with poor or failing schools should be allowed to choose any school that would accept their children and that public funds for the payments of education should follow the child. This should be the case even if the child went to a religious school. This, of course, raised the question of the separation of church and state and the legality of using public funds to support schools with an obvious religious orientation. In particular, it was argued that public funding of religious

schools was a violation of the establishment clause of the First Amendment of the U.S. Constitution.

In 2002, the U.S. Supreme Court held in the case of *Zelman, Superintendent of Public Instruction of Ohio, et al. v. Simmons-Harris et al.* that the Ohio Pilot Project Scholarship Program, which gave parents public funds to pay for their children's education, did not violate the First Amendment clause against the separation of church and state. In a 5–4 decision, it was held that the Ohio program did not violate the establishment clause of the First Amendment because it passed the Court's five-part choice test. This meant that a voucher program must have a valid secular purpose, it must be neutral in regard to religion, monies must be paid directly to parents, the class of beneficiaries must be broad, and there must be educational choices other than religious schools. Given these criteria, the Ohio voucher plan was constitutional.

Evaluations

While the constitutionality of a voucher system may be settled, studies on the impact of a voucher system to improve the quality of urban education have been mixed. Milwaukee, Wisconsin, implemented one of the nation's first vouchers systems in 1990. As expected, there is a great deal of debate as to whether the system has improved urban education and offered parents more educational choice. Proponents and opponents of vouchers used the Milwaukee experiment as a test case for the viability of vouchers. There has been no clear winner in this contest.

Prochoice advocates, as they are called, have produced data that purport to show the educational gains of urban school children in schools with voucher support. Opponents counter with claims of faulty data collection and political bias. Yet, everyone agrees that the education of African American children has improved only slightly, while they disagree about the impact of vouchers.

There is little debate that African American parents should have control over both the quality of the education their children receive or that public schools should be safe havens for children. The role of vouchers as a method and to lessen

governmental intervention in the educational process will continue to be debated.

W

WARD V. FLOOD

Ward v. Flood, decided by the Supreme Court of California in January 1874, is a case that arose when an 11-year-old African American student in San Francisco, Mary Frances Ward, was denied admission to her local school because of her race. She and her guardian ad litem sought a writ of mandamus to compel Noah Flood, the principal of Broadway Grammar School, a White public school, to admit her. However, the California Supreme Court ruled that separate schools did not violate the Fourteenth Amendment. This decision formed the bedrock of the “separate-but-equal” doctrine of *Plessy v. Ferguson*, decided in by the U.S. Supreme Court in 1896, which was later overruled by *Brown v. Board of Education of Topeka, Kansas*, in 1954.

In 1872, when *Ward v. Flood* was commenced, California maintained separate school systems for White students and for African Americans and Native Americans. The School Law of California, passed April 4, 1870, stated in Section 56 that the education of African American children and American Indian children would be provided for in separate schools, and Section 57 provided that the same laws, rules, and regulations would apply to schools for White children and to schools for “colored” children.

Proceeding from the premise that the right to public education was established under the state constitution and laws, and not under the federal

law, Chief Justice William T. Wallace emphasized that the equal protection clause of the Fourteenth Amendment “did not create any new or substantive legal right, or add to or enlarge the general classification of rights of persons existing in any State” under the laws existing at the time of its adoption. Specifically, he stated: “It, however, operated upon them as it found them already established, and it declared in substance that, such as they were in each State, they should be held and enjoyed alike by all persons within its jurisdiction.”

Emphasizing “the education of youth is emphatically their protection” and that “ignorance, the lack of mental and moral culture in earlier life, is the recognized parent of vice and crime in after years,” Justice Wallace concluded that being separate is not “obnoxious” to the equal protection requirements of the Fourteenth Amendment, provided the schools are equal in their instruction and in all other respects. He noted that San Francisco separate schools were not only authorized by law but in fact also maintained for the education of African American children “with able and efficient teachers, and which afford equal advantages and are conducted under the same rules and regulations as those provided for the education of white children.” Indeed, counsel for the defendant had contended that in some respects African American children enjoyed superior educational advantages. Noting that it had been urged that the maintenance of separate schools tends to deepen and perpetuate the odious distinction of caste, founded on a deep-rooted prejudice in public opinion, Justice Wallace, speaking for the California Supreme Court, stated

as follows: “This prejudice, if it exists, is not created by law, and probably cannot be changed by law.”

Numerous studies and expert views from sociologists, psychologists, and educators that were brought to the forefront in *Brown v. Board of Education of Topeka, Kansas* (1954) have shown that education embraces more than just book learning and includes developing relationships, learning about and appreciating other cultures, and building the skills and understanding needed to deal with others in an increasingly diverse world and competitive global marketplace. Further, educating persons who feel inferior and “left out” is far more difficult, and their achievement levels are much lower than those of children who feel equal and are thus motivated and confident that they can achieve the heights of knowledge and skills as persons of any other race or ethnic origin. The need for cultural association and intermingling in education—and indeed in other fields of endeavor—was fully recognized in *Grutter v. Bollinger* by the U.S. Supreme Court in 2003 and the related case of *Jennifer Gratz v. Lee Bollinger* (1974).

Nevertheless, inner-city schools across the United States are still largely segregated schools as a result of segregated housing patterns and poverty, and many youth are denied the cross-cultural educational environment that would improve their overall knowledge base and learning skills. While there has been some increase in desegregation and intermingling in the educational process since the *Brown* decision, African American and/or Latino children often make up the majority of the student body in inner-city schools. Because of their lack of exposure to children from other cultures, poverty, and lack of encouragement at home, they often drop out of school without obtaining even a high school diploma. Isolation of African Americans and Latino children in low-performing schools has adversely affected achievement levels, including performance on tests under No Child Left Behind (2001) federal legislation, and has resulted in higher dropout rates, leaving students unprepared for the technological world of the 21st century and jobs that require a higher level of education and job skills than these students possess. Some parents fight to get their children who are excellent students in a city’s top-performing schools or put them in private schools sometimes at substantial economic sacrifice, leaving poor-performing students in a city’s low-performing schools.

The quality of all of our schools—in inner cities and in rural areas—must be improved to ensure that students of all racial-ethnic backgrounds have access to a quality education, regardless of their economic and social class status. Federal, state, and local governments will need to find ways and means, and the funding sources, necessary to raise the educational level of all students in the nation.

WASHINGTON, BOOKER T. (1856–1915)

In the evolution of African American education, no historical personality stands out more than Booker Taliaferro Washington, commonly known as Booker T. Washington, who rose from enslavement to the heights of the United States and world society; who, having a brilliant mind, mastered skills that enabled him to become not only a top-notch educator but also a consummate administrator; who served as a key leader of African Americans; and who stands at the center of a perpetual controversy concerning the optimal development path for African Americans.

This entry addresses each of these aspects of Washington’s life. In addition, these characteristics and accomplishments are used to assess whether history supports the notion that Booker T. Washington is one of, if not the most prophetic and visionary African American leader of all time.

Early Years

Washington's lasting contribution to the literary history of African Americans in the United States is titled *Up From Slavery*. He was born in 1856, as an enslaved African in Franklin County, Virginia. In this book, he recounts stories that span his early life through 1901 when he had completed 20 years as president of Tuskegee Normal and Industrial Institute—now known as Tuskegee University.

Washington was a young boy when the Civil War ended in 1865, and he recounts in *Up From Slavery* the day the master of the plantation on which he lived summoned all his enslaved Africans to the “big house” to hear the reading of the Emancipation Proclamation and to be told that they were free to live their own lives. Shortly thereafter, his family relocated to Malden, West Virginia, where he worked in salt and coal mines and as domestic help for wealthy Whites. It was during this period that a fire for education began to burn in his consciousness—a fire that would never be extinguished and that he learned to use as a source of energy for his own learning and to direct the learning of many others. In his late teens, Washington learned about ongoing training of African Americans at the Hampton Institute in Virginia and vowed to let nothing separate him from the opportunity to learn at Hampton.

In the fall of 1872, Washington began training at Hampton and met General Samuel C. Armstrong—the founder of Hampton Institute. During his 2 years at Hampton, Washington came to highly value General Armstrong's principles of industry and inculcated them as his own. After completing the 2-year program at Hampton, where he made a powerful impression on General Armstrong, spending 2 years as an educator in his hometown of Malden and studying in Washington, D.C., for 9 months, Washington was called back to Hampton for more study and to serve as a leader of a program to train Native Americans. It was during this stint at Hampton that Washington received the call from Tuskegee to develop a normal school.

Tuskegee Years

In the spring of 1881, Washington arrived in Tuskegee, Alabama, to begin what was to become a prolific and productive career of education institution building.

Using a stable and a hen house as classrooms, Washington began classes with 30 students. Displaying masterful leadership, planning, fund-raising, management of personnel, and strategic risk taking, Washington guided Tuskegee to become the most renowned African American academic center for learning by the time of his death in 1915.

Washington and his staff developed a broad industrial training program at Tuskegee, very much like the training program at Hampton. For males, there was carpentry, brick masonry, architectural design, veterinary training, agricultural, and more. Females were trained in laundering, sewing, health, and food sciences. For both genders, there was normal school training of teachers. What was special about Tuskegee was that Washington incorporated a very strong applied aspect of training into the program: Students were required to actively participate in applying their chosen trade—from helping build structures on the Tuskegee campus to producing and preparing garden and animal produce for consumption.

Beginning with nothing except a \$2,000 annual appropriation from the State of Alabama for salaries, Washington grew Tuskegee to an institution with property and an endowment valued at more than \$2 million by the first decade of the 20th century. More important, Washington almost single-handedly orchestrated the training of young, and sometimes not so young, African American men and women in the aforementioned fields of education and industry. These Tuskegee alumni fanned out all over the nation and around the world to serve as Washington's disciples in spreading a philosophy of love of labor and the use of industry to achieve success.

Outlining a Philosophy

Washington's rapid progress in building Tuskegee was fueled, in no small measure, by his fund-raising efforts and those of his staff members. He received a big boost from his connection with General Armstrong, who introduced him to many philanthropists across the country. These fund-raising ventures presented an opportunity for Washington to speak often and widely about challenges facing African Americans as they sought to grow up as positively contributing citizens following the antebellum and Reconstruction periods. He developed a reputation as a dynamic orator and

was invited to serve as a representative of African Americans in various forums—including appearing before the U.S. Congress. However, it was an invitation to speak during the Atlanta Cotton States and International Exposition on September 18, 1895, that propelled Washington into the national spotlight from which he would never be completely removed.

It was during this speech, the so-called Atlanta Compromise, that Washington elaborated on his philosophy that African Americans and Whites could remain separate in all things social while being unified in all things essential to mutual progress—that is, in industrious efforts to rebuild the South specifically and to continue building the nation generally. In addition, he commented on the inappropriate evolution of African American life in the United States during Reconstruction, which commenced for many African Americans at the top as opposed to at the bottom in industry and building a steady program of industrial training. The latter, he argued, was a natural and logical process for a people who lacked almost everything when freedom came.

These two key ideas of Washington's were received very favorably by most Whites, especially those in the South. However, for some African Americans across the nation, these ideas sounded a tone of acquiescence and softness on African American civil rights. Washington's ideas and philosophy were to become the heart of a controversy over the appropriate approach to African American development for the remainder of his career and beyond.

Nevertheless, Washington's address at the Atlanta Exposition marked him as a leader of African Americans. It was not long before he was traveling up, down, and across the country to speak about his work at Tuskegee and about African Americans in the United States. He held annual conferences on African American issues at Tuskegee; helped establish a Black Business League; was consulted on issues involving African Americans, and he advised U.S. Presidents Theodore Roosevelt and William Taft. On June 24, 1896, Harvard University bestowed upon him an honorary master's of arts degree, the first ever awarded to an African American. As another symbol of the heights to which he rose, during a 3-month vacation trip to Europe in 1899, which

was sponsored by philanthropists who respected and valued his work, Washington met with high-ranking officials in several European countries—including Queen Victoria of England.

Debate With Du Bois

At the heart of the aforementioned controversy was the question of whether education for African Americans should follow a curriculum like that of traditional White schools in the Northeast. Such schools focused on the letters of Greek, Latin, European, and U.S. languages and literatures and the high sciences of physics, chemistry, astronomy, and mathematics. Another option, consistent with the tradition established by General Armstrong at Hampton, was education for African Americans that would feature training related to the practical industries of agriculture, laundering, sewing, construction trades, veterinary sciences, and so on. Scholars such as W. E. B. Du Bois favored the former, while Washington favored the latter. So heated and vigorous was the debate that, later, African American poet Dudley Randall was inspired to pen the poem "Booker T. and W. E. B."

Du Bois and his colleagues believed that the African American "Talented Tenth" should be permitted pursuit of higher learning and the formation of a leadership core for formerly enslaved Africans. They criticized Washington's emphasis on industrial education to the virtual exclusion of higher education. Moreover, they rejected Washington's willingness to set aside the need for immediate and persistent confrontational efforts to obtain suffrage and civil rights for African Americans. They also argued that Washington's educational philosophy and nationally powerful influence impeded the flow of financial support to African American institutions of higher learning that could produce and support the Talented Tenth. Most important, they felt helpless to promulgate their own plan for African Americans against a pervasive Tuskegee machine that developed and controlled the flow of information about all things of importance to African Americans.

Washington, on the other hand, believed that African Americans were best served by training to become expert in fields in which African Americans already had some familiarity and for which employment was virtually guaranteed. He believed that, by taking this approach, African Americans would be

able to develop material wealth and be included by the larger society because they filled essential roles. Using this wealth and good relations, African Americans would be able to secure political and civil rights at an appropriate point in time. At a minimum, training in practical trades made it possible for African Americans to build self-sufficient and sustaining communities. Washington not only held these beliefs deeply, but, as stated previously, he also demanded that Tuskegee students apply this philosophy as an integral part of their training.

The Test of History

Proof of the soundness of ideas often lies in the unfolding of history. Was Washington or Du Bois the greater visionary? Experts may argue for both. Indeed, the reality at the beginning of the 21st century is that colleges and universities are converging on the principle that it is insufficient for their alumni to possess academic knowledge alone. One institution after another is adopting supplemental training programs that are designed to ensure that students are able to translate academic knowledge into a practical and applied entrepreneurial framework. Today's ultimate question for graduates is, How can you use your education to create a profitable venture? All of this sounds consistent with Washington's principles and philosophies.

While Du Bois lived into the 1960s, he never achieved the type of popular acclaim that Washington enjoyed at the turn of the 20th century. Moreover, Du Bois was never called upon to build the type of permanent infrastructure that is required to institutionalize a learning tradition and to promulgate a philosophy like that established and perpetuated at Tuskegee Institute. In addition, Du Bois never equaled Washington in building a network of adherents who not only were indoctrinated with his principles and philosophy but who, because of their training at Tuskegee, went on to replicate the Washington mind in their communities.

The nation is yet young; however, few African Americans, to date, have displayed the character, fortitude, genius, ability, and sheer will to place their people on a development path that has stood the test of time as has Booker T. Washington. History shows that his ideas, principles, and philosophy concerning education and training for African Americans were visionary and long lasting.

The details of the purpose, intent, and application of Washington's plan are readily accessible. It would not be surprising if, in the future, Washington's plan is resurrected, modified as appropriate, and implemented to lift African Americans up from economic, social, and moral shortcomings to enjoy the type of success that Washington enjoyed during his lifetime.

W. DEEN MOHAMMED HIGH SCHOOL (ATLANTA, GEORGIA)

W. Deen Mohammed High School was established in 1988 by the Atlanta Masjid of Al-Islam, an African American Muslim community in Atlanta, Georgia. It is a private coeducational Islamic (religious) school providing 9th- through 12th-grade educational services to students regardless of race, religion, or national origin. Funded by the African American Muslim community, W. Deen Mohammed High School teaches all subjects

required by the state in addition to the Qur'an, Islamic studies, and the Arabic language. It has a highly regarded athletic program. This entry looks at the school's founding and development and at its educational strategy.

Historical Background

Initially established to support the graduates of the local Clara Muhammad Elementary School, the high school was originally called the Clara Muhammad High School until 1987. In 1988, the community acknowledged the need for a quality Islamic high school for all students, particularly graduates from Clara Muhammad Schools throughout the United States, and the name W. Deen Mohammed High School was chosen. It was determined that Imam W. Deen Mohammed, the son of Clara and Elijah Muhammad, deserved distinction as a result of making education the number one priority of the African American Muslim community and for transforming the Nation of Islam in 1975, which had been headed by his father, from a race-centered philosophy to the universal philosophy of Al-Islam.

To accommodate out-of-state students, the Atlanta Masjid of Al-Islam organized families who agreed to host (board) students for the school year. These "host families" provided an invaluable service that enabled interested families to enroll their children in the school, overcoming one of the major obstacles of local residency. As a result, W. Deen Mohammed High School has drawn students from around the country.

The first graduating class in 1992 had eight students—three males and five females. The school was accredited in 1998 by CITA (Commission on International Trans-Regional Accreditation) and "Accredited With Quality" in 1999 by SACS (the Southern Association of Schools and Colleges), and GAC (Georgia Accrediting Commission); it has had a working relationship with Clark Atlanta University for ongoing teacher education. The school has a 100% graduation record. The school prides itself on students performing at least two to three grade levels above students in other schools and as a result, 99% of its graduates are offered scholarships to and matriculate from Ivy League universities in the United States. Further distinction arises from its renowned athletes in men's swimming—although

the school does not have a swimming program—and their celebrated male and female basketball teams, the Caliphs and the Lady Caliphs.

Alumni and Achievements

Graduates of W. Deen Mohammed High School include three medical doctors—graduates of Morehouse School of Medicine, Columbia University, and Meharry Medical School—with one alumni in residency at Johns Hopkins Hospital; two PhDs—a professor of Islamic studies at Spelman College and a professor of biology at Morehouse College who is a Clara Muhammad School alumni; a graduate of Harvard University and Emory University, now a practicing attorney; a Fulbright Scholar; an international businessman; a White House intern; two swimmers who participated in Olympic trials; a Most Valuable Player at the National Invitational Tournament for Georgia Tech; and many responsible citizens and dedicated parents. Graduates have also received scholarships to study abroad.

The outstanding athletic program was enhanced by the building of the Shareef Abdur-Rahim Gymnasium, which bears the name of its chief contributor and former student of Clara Muhammad School and National Basketball Association star Shareef Abdur-Rahim, who played for the Vancouver Grizzlies, Atlanta Hawks, and the Sacramento Kings. W. Deen Mohammed High School expanded to Oakland, California, in 2002, opening with 12 students. That school has continued the tradition of academic excellence and is accredited by the National Association of Private Schools.

Educational Strategy

W. Deen Mohammed High School believes that education is sacred, a human right, and required for a civilized society. It believes the purpose of education is to nourish the human being toward a higher awareness of his or her purpose in life, beginning with God consciousness, moral integrity, and social responsibility. The school believes that everyone possesses an inherent capacity for intelligent life, and the need for fulfillment of that intelligent life binds one to morally sound and intelligent behavior. It believes education should meet the challenge of the environment in which it is imparted; it should enable its recipients to address the physical, social,

and psychological realities of the world in which they live; and it must always aim at excellence.

W. Deen Mohammed High School believes its students are obligated to understand the history and challenges peculiar to the United States and the African American community and to honor and give back to their community. It also fosters an appreciation for the noble principles upon which the United States was founded that contribute to the cultivation of the qualities of good citizenship.

At W. Deen Mohammed High, competencies and instructional methods are based on Islamic principles to ensure that each student's behavior is consistent with that of a civilized member of society, responsible for self, family, and community, locally and globally. The expansive curriculum includes human development, in which students are taught to revere God first, to appreciate and respect people of all ethnicities and cultures as one human family, and to strengthen an appreciation of the African American experience as a significant development in human history and destiny. Students are taught to develop an appreciation for the value of religion in human existence and Al-Islam as a total system of life. The curriculum provides an integration of Islamic, African, and African American cultural sensibilities. Students are prepared to be enlightened leaders and global citizens whose values are democratic and humane and who are willing to work for a more just and equitable society and world.

WHITE FLIGHT

The phenomenon known as "White flight" is commonly associated with the demographic shifting of working- and middle-class White U.S. citizens from the urban areas of the United States to outlying suburbs and exurbs. According to geographers, sociologists, economists, political scientists, and other researchers, White flight partly contributed to the concentration of African American people in urban communities, that resulted in communities and schools that became predominantly African American in a short span of time. This entry looks at the historical context of White flight and its consequences for African American education.

Historical Context

White flight began to occur shortly after World War II, a time in which there was a squeeze on properties located in major urban areas, and U.S. prosperity after the war facilitated the rise of suburbs. During this time (shortly after 1945), African American people were in the midst of the Second Great Black Migration, and more than 5 million people were making their way from rural southern towns into urban industrial areas of the United States, particularly in the Midwest and Northeast. Although the passage of *Brown v. Board of Education, Topeka, Kansas*, in 1954 eradicated the legal segregation of public schools, White flight played a critical role in creating the de facto racial segregation of African American people in urban communities and schools during the 1960s and afterward.

As African American people became a more urbanized population during the 1950s and 1960s, White people began to feel threatened by the increasing African American presence in these urban centers. The prevalence of the automobile and the building of interstate systems, especially

through the areas of the cities where African American people resided, played a critical role in ensuring White families that African Americans could reside in one area and work in another.

This pattern of White flight from urban areas escalated after the 1954 U.S. Supreme Court decision in *Brown v. Board of Education*. As there was already a demographic shift toward the suburbs, urban areas and urban school systems increasingly became less and less White and more and more African American. After efforts were stepped up to enforce *Brown* through the desegregation of public schools, many Whites made no secret of their feelings about living near African Americans and attending schools with them, not only verbally but also by moving to suburban and outlying communities.

In many instances, these actions were facilitated and encouraged by White communities and realtors through race steering and other means of deterring African Americans from moving into these suburban neighborhoods. And when White families could not afford to leave the urban centers, they did all they could to prevent African American families from enrolling their children into the urban schools. For example, in cities such as New Orleans, White families pulled their children out of the schools altogether. In other cities such as Chicago, district officials adjusted boundary lines, assuring that the schools remained segregated.

Impact on Urban Schools

In addition to White citizens' resistance to desegregation and the mandates of *Brown*, their massive exodus to suburban communities struck another unexpected blow to desegregation efforts that sought to make *Brown* a reality. When White citizens began to depart the cities for the suburbs, so did the financial resources and political support for urban schools. In addition to an ever-increasing African American population that Whites felt little obligation to educate, these new African American school leaders also inherited myriad financial and social concerns.

Urban centers and school districts throughout the United States, such as those in Detroit, Milwaukee, Atlanta, and St. Louis, witnessed an increasingly low-income African American student population and contended with serious fiscal and social crises as a result of social and economic changes in the broader U.S. society. With the loss of a political and

economic base, the communities and schools in these areas began to experience a decline.

The 1971 U.S. Supreme Court decision in *Swann v. Charlotte-Mecklenburg* provided a glimmer of hope for desegregation proponents because it mandated the busing of students across district lines. African American students were bused to predominantly White suburbs, and White students from suburbs were bused into the city. However, in a ruling in 1974, *Milliken v. Bradley*, the U.S. Supreme Court changed the course of desegregation when the justices ruled 5–4 to exempt 53 suburban school districts in metropolitan Detroit from participating in cross-district desegregation with the city of Detroit. The majority argument was that the 53 suburban communities and school districts did not intentionally contribute to the creation of predominantly African American and segregated schools in Detroit. Thus, the court limited *Brown's* influence by asserting that the court case banned de jure (legal segregation), not de facto segregation caused by individuals' voluntary housing patterns. In essence, desegregation plans could be undermined by White families' flight into suburban school districts.

But despite the *Milliken* decision, some school districts throughout the United States continued to operate under court-supervised desegregation plans. Some of these districts voluntarily operated interdistrict desegregation plans. One of the largest voluntary desegregation plans was the St. Louis Inter-District Transfer plan. In 1983, the city of St. Louis became the site of the nation's largest voluntary desegregation plan. Through a system of voluntary choice, the plan allowed African American parents in the city of St. Louis to send their children to their assigned neighborhood schools, to magnet schools in the city, or to schools in one of 16 participating, predominantly White county school districts. White parents who resided in one of the 16 participating county school districts had the option of sending their children to magnet schools in the city.

During the 1960s, 1970s, and 1980s, the White population decreased dramatically in the urban centers of the United States and increased in the suburbs. Whereas there were multiple factors that caused this decline, such as African American influx into the cities, the expansion of interstate travel, and so on, White parents' resistance to their children being educated in schools with African American children fueled White residents' flight

away from central cities—those places where African American people lived.

The Future of African American Children

Since the 1980s and 1990s, there has been an increasing presence of African American families in once predominantly White suburbs—what can be called “Black departure.” But just as African American people are increasingly present in suburban contexts (more than one third of all African Americans at the turn of the 21st century live in suburban settings), urban centers during the 1990s experienced a return flight of White people. This phenomenon, called “gentrification,” is a process by which more prosperous individuals move into and refurbish inner-city areas that have experienced decades of neglect, often resulting in the displacement of lower-income residents who can no longer afford to pay the increased property taxes on their homes.

What will happen to the low-income African American children of these families that have been displaced is something that remains to be seen. One thing that is clear, however, is that despite the direction of White U.S. residential patterns and the subsequent impact on the racial composition of schools—whether they move away from or toward the areas where African American people reside—it is imperative that efforts to achieve quality schooling for African American students must make these children a primary focus.

WOMEN'S STUDIES

Women's studies as a distinct entity within higher education in the United States appeared in 1969–1970 with the establishment of the first program at San Diego State University. The National Women's Studies Association (NWSA), the professional association for the field, identifies more than 900 programs in the United States, which enroll the largest number of students in any interdisciplinary field, and well over 10,000 courses. In addition to a professional association, there are numerous refereed women's studies journals (over 30 in the United States), numerous journal articles, and hundreds of monographs by university presses and trade publications. Women's studies programs have expanded internationally and can be found in Europe, Canada, Mexico, Argentina, Costa Rica, and the English-speaking Caribbean, as well as India, Indonesia, China, Korea, Japan, and Africa (Uganda and South Africa). Doctoral programs have been established at more than 10 U.S. universities (the first ones at Emory University and Clark University), as well as in Canada, Australia, and England. Colleges and universities across the nation routinely advertise faculty searches in women's studies as well as award prestigious endowed professorships in women's studies. In addition to higher education, there is a growing domestic and international market for women's studies scholars and practitioners in government and nongovernmental organizations, policy and research institutes, foundations, and nonprofit organizations.

While the first phase of the evolution of women's studies in the academy during the 1970s focused on

the establishment of the field as a separate discipline, the 1980s ushered in a second phase that focused on “mainstreaming” women’s studies throughout the established male-focused curriculum. This process of bringing about a gender-balanced curriculum represented an attempt to deghettoize women’s studies and to incorporate it into the rest of the academic enterprise. The objective was to incorporate feminist scholarship or new scholarship on women and gender within all the academic disciplines by initiating curriculum transformation projects in academic settings throughout the United States. The history of women’s studies in higher education involved the development of separate women’s studies courses and autonomous programs, as well as mainstreaming projects whose aim was the creation of gender-balanced courses in various disciplines, particularly in the humanities and social sciences.

One of the earliest of these curriculum integration projects in women’s studies was launched in 1981 at the University of Arizona. Initially a 4-year, cross-disciplinary project, funded by the National Endowment for the Humanities (NEH) and later the Ford Foundation, the program developed an interdisciplinary format that provided a model for subsequent curriculum integration projects. A steering committee of women’s studies professors designed and conducted faculty development seminars that focused on analyzing major texts in feminist theory and discussing teaching strategies in women’s studies classrooms. Numerous curriculum integration projects followed, the best known of which was initiated in 1980 at Wheaton College, in Norton, Massachusetts, with funding from the Fund for the Improvement of Postsecondary Education (FIPSE). The collegewide goal of the program was to integrate the new scholarship on women into introductory courses in various disciplines. In 1983, Wheaton convened the first national conference on curriculum integration in women’s studies. FIPSE, which assumed a leadership role in such projects, also funded curriculum development by Smith College’s Afro-American Studies Department and the University of Massachusetts’ Women’s Studies Program that intended to bridge the gap between African American studies and women’s studies.

In the late 1970s, African American women began to critique both women’s studies and curriculum integration projects for their lack of attention to questions of racial-ethnic, class, or cultural differences in

definitions of womanhood. One of the hardest-hitting critiques of the insensitivity of women’s studies to race, class, and ethnicity can be found in the pioneering work of Black feminist theorist bell hooks, especially in *Feminist Theory From Margin to Center* (1984). A new field of study, Black women’s studies, also emerged because of the failure of both African American studies and women’s studies to adequately address the unique experiences of African American women and around the globe. It provided the conceptual framework for moving African American women from the margins of women’s studies to the center and provided the catalyst for initiatives to incorporate “minority women’s studies” into core curricula in diverse academic settings. *All the Women Are White, All the Blacks Are Men, But Some of Us Are Brave* (1982), edited by Gloria Hull, Patricia Bell Scott, and Barbara Smith, defined Black Women’s Studies, traced its development, provided a rationale for its existence, and analyzed its implications for curriculum and societal reform.

The founding of *SAGE: A Scholarly Journal on Black Women* in 1983 (hosted by the Women’s Research and Resource Center at Spelman College and coedited by Patricia Bell Scott and Beverly Guy-Sheftall) was a major milestone in promoting scholarship on women of African descent around the globe; its other editors included Professors Jacqueline Jones Royster (Spelman College), Janet Sims-Wood (Howard University), Miriam DeCosta Willis (Howard University), and Lucille Fultz (Rice University). It appeared at the height of an African American women writers’ renaissance that included Toni Morrison, Paule Marshall, Alice Walker, Ntozake Shange, Audre Lorde, Toni Cade Bambara, and others. The theme of its first issue in April 1984 was Black women’s education. In subsequent issues, themes included Black women’s studies, Africa and the diaspora, women as writers, women as workers, artists, and artisans, leadership, science and technology, health, relationships, and male kin. One of its thematic issues, mothers and daughters, led to the publication of the landmark text on African American mothers and daughters, *Double Stitch: Women Write About Mothers and Daughters* (1992), edited by the SAGE collective. The journal also served as the focal point of the SAGE Scholars Internship Program at Spelman College, which in 2001 became the Toni Cade Bambara Collective; it sponsors an annual Toni

Cade Bambara scholars and activists conference during Women's History Month in March. In collaboration with Spelman's Comprehensive Writing Program, the internship program enabled a select group of students to learn, firsthand, the dynamics of publishing a scholarly journal and be mentored by some of the most influential feminist scholars and writers in the academy and beyond. The presence of *SAGE* (published from 1983 to 1996) also signaled the coming of age of Black women's studies and illustrated the importance of feminist theorizing around the intersection of race, class, and gender within the evolving field of women's studies. Along with Black women's studies, scholarship by and about other women of color also generated oppositional discourses that challenged the ethnocentrism of mainstream women's studies methodologies.

A historical perspective on the development of women's studies in African American higher education begins with Spelman College, the older of only two historically Black colleges for women in the United States. In 1981, the Women's Research and Resource Center was founded with a grant from the Mott Foundation; its primary goal was the establishment of a women's studies program, the first on a historically Black college campus. In 1983, under the auspices of the center, Spelman engaged in the first curriculum integration project in women's studies at a Black college. The goal of this Ford-funded project was to invigorate its liberal arts curriculum by redesigning introductory courses to reflect the new scholarship on women generally, but especially African American women, in the United States and beyond. Courses such as freshman English, world literature, introduction to sociology, and introduction to psychology were targeted and revised.

During the early years, the Women's Center broadened its program to include an international component that focused on third world women, with special attention to women from Africa, Asia, India, and the Caribbean. In support of this global outreach initiative, the center launched an enrichment program for African women living in Atlanta. To further the center's evolving global dimension, it led a delegation of women to the 1985 UN Decade Conference on Women in Nairobi, Kenya. In 1995, a similar delegation traveled to Beijing, China, to attend the Fourth UN Conference on Women. Also in the 1980s, Spelman became one of the most sought-after sites for national conferences that addressed women's

issues in general and African American women's issues in particular. The first conference, organized by the Women's Center in 1982, examined African American women's public policy issues. The second gathering, the first National Black Women's Health Conference, was held in 1983 under the auspices of the National Women's Health Network, and provided the impetus for the founding of the National Black Women's Health Project. With more than 1,500 participants, the conference was the largest women's conference to have been convened on a Black college campus. In 2005, the center convened an international, invitational conference on "Women, Girls and HIV/AIDS in Africa and the African Diaspora." Funded by the Ford Foundation, it was the first conference of its kind on a Black college campus and included faculty from historically Black colleges and universities (HBCUs) as well as delegations from Brazil, Senegal, and the Caribbean.

In June 1987, Spelman hosted the 10th anniversary of NWSA, whose theme was "Weaving Women's Colors: A Decade of Empowerment." This conference marked the first meeting of NWSA on a Black college campus. In 2008, Beverly Guy-Sheftall, founding director of Spelman's Women's Center, was appointed president of NWSA. When Johnnetta Betsch Cole, a former professor of African American studies and women's studies, was appointed president of Spelman College in 1987, she convened a Black Women's Studies Task Force to explore the feasibility of establishing both women's studies and African American studies majors. In 1996, after having established a minor in 1982, Spelman became the first historically Black college to offer a women's studies major. In 1992, the Anna Julia Cooper Professorship in Women's Studies was established with a grant from the Mott Foundation and matching funds from William and Camille Cosby. Spelman is the only Black college with a women's studies major, a women's center, and an endowed chair in women's studies.

While the evolution of women's studies at Spelman has not been typical of African American coeducational institutions, and while there is no history of women's studies in African American higher education, there were early efforts, largely on the part of African American women faculty, to bring women's studies to Black campuses. The most noteworthy project in this regard occurred at

Atlanta University (now Clark Atlanta University), whose Africana Women's Center, founded by political science professor Shelby Lewis, initiated a graduate degree program in Africana women's studies in 1987. The project also involved faculty development in Africana women's studies at four other predominantly Black colleges—Hampton University, Atlanta Junior College, Southern University, and Jackson State University. The project was managed by their Women's Institute of the Southeast Developmental Project in Africana Women's Studies, funded by FIPSE from 1982 to 1985. Atlanta University's Africana Women's Center held the first national conference on Africana women's studies in the United States in December 1985. Clark Atlanta University offered the first and only doctoral program in Africana women's studies, which was an outgrowth of the early work of the Women's Center at Atlanta University.

In 2002, Johnnetta Betsch Cole assumed the presidency of Bennett College for Women, one of only two historically Black colleges for women, and provided leadership for the development of an Africana women's studies program. With funds from the Mott Foundation, Bennett College also established a Mott Professorship in Africana Women's Studies. The chair has been held by anthropologist Irma McLaurin, the first director of the program, and Valerie Kaalund, now director of the program. Tennessee State University, Morgan State University, Howard University, and Medgar Evers College also have women's studies programs, though Spelman College remains the only historically Black college with both a women's studies major and a women's research institute.

Despite the development of women's studies at Black colleges and universities, this work has been largely invisible in the scholarship on curriculum transformation in the liberal arts as well as in histories of women's studies in U.S. higher education. Sorely needed is a comprehensive history of the development of women's studies at Black colleges and universities. Without such research, it will be difficult to capture this history in its entirety and over time.

WOODSON, CARTER G. (1875–1950)

During the first half of the 20th century, Carter Godwin Woodson, “The Father of Black History,” laid the foundation for the rigorous study and popularization of African American history. A committed educational reformer and forerunner of the interwar Intercultural Educational Movement, Woodson was the central figure in the early African American history movement that lasted from the founding of the Association for the Study of Negro Life and History (ASNLH) in 1915 until his death in 1950. Not only was Woodson a prolific scholar, but he also systematically democratized, popularized, and legitimized the study of African American history in U.S. educational institutions and popular culture during the era of Jim Crow segregation.

Before his sudden death on April 3, 1950, Woodson accomplished a great deal and wore many different hats. He served as a high school teacher and college professor; he earned a doctoral degree in history from Harvard; he produced an important body of scholarship; he founded the first major organization and scholarly journal devoted to promoting, documenting, and studying African American history; he mentored many professionally and nonprofessionally trained African American scholars; he joined and/or supported

organizations like the Committee of 200, the National Urban League, the NAACP, the Friends of Negro Freedom, the New Negro Alliance, and the National Negro Business League; and he worked tirelessly as a leader, activist, and spokesperson for African American advancement.

Woodson was born in New Canton, Virginia, toward the end of the Reconstruction era, on December 19, 1875. Woodson's parents, James Henry and Anne Eliza (Riddle), had been formerly enslaved, and they shared with him and their other children firsthand histories of life during enslavement. As an adult, Woodson recalled that his parents instilled within their children a respect for education and the philosophy of self-determination and character building. A year before Woodson's birth, his parents had settled in New Canton, Virginia, buying a farm of 21 acres. Woodson grew up on his parents' farm and attended school for only 4 months out of the year. He worked on the family farm until he was about 15 and then secured a job as a farm laborer and a jack-of-all-trades in Buckingham County, Virginia. Two years later, Woodson moved to Fayette County, West Virginia, to work in the coal mines. In his late sixties, looking back on his life, Woodson described this period as very significant to his intellectual development. In the coal mines, he met an African American Civil War veteran named Oliver Jones, who allowed many of the coal miners to use his home as an intellectual movement center. Being the sole literate worker of the group, Woodson read newspapers to his coworkers. Jones also had a valuable library of books containing classic works by pioneering African American scholars.

At the age of 20, Woodson returned to West Virginia and attended Frederick Douglass High School. It took him only 2 years to finish the requirements for graduation. In the fall of 1897, he enrolled at Berea College, in Kentucky. It took him more than 5 years to receive a BA from Berea. For financial reasons, he left Berea in the 1897–1898 academic year. From 1898 until 1900, he worked as a teacher for a school in Winona, West Virginia, where he educated the children of African American miners. From 1900 until 1903, he worked at his high school alma mater, teaching history and serving as the principal. Woodson received a bachelor's degree in literature from Berea in 1903. From mid-December 1903 until early February 1907,

Woodson traveled abroad extensively. For roughly 5 years, under the auspices of the U.S. War Department, he was stationed in the Philippines "to train the Filipinos to govern themselves," teaching English, health, and agricultural classes. After leaving the Philippines in early 1907, Woodson briefly traveled around the world and spent roughly half a year in Europe. He briefly attended the Sorbonne.

After returning from Europe, Woodson enrolled in the University of Chicago and earned an MA degree in history, romance languages, and literature in the summer of 1908. Woodson then enrolled in Harvard University as a doctoral student. In 1909, he left Cambridge and settled down in the Washington, D.C., area, teaching French, Spanish, English, and history at the prestigious M Street High School. Woodson finished his coursework in less than 2 years and submitted the first draft of his dissertation in the spring of 1910. His committee, consisting of Albert Bushnell Hart, Edward Channing, and Charles Haskins, made many suggestions for revision. In April 1912, Woodson completed his PhD dissertation, *The Disruption of Virginia*.

Three years later, in 1915, at the age of 40, Woodson published his first monograph, *The Education of the Negro Prior to 1861*. On September 9, 1915, Woodson cofounded the Association for the Study of Negro Life and History (ASNLH) in Chicago with George Cleveland Hall, James E. Stamps, and Alexander L. Jackson. The purpose of the organization was to collect records pertaining to African Americans' past and disseminate the "truth" regarding African American history. The ASNLH was one of the first scholarly organizations of its kind to be founded early during the era of Jim Crow segregation. Early on, the association developed intimate connections to the heart of African American communities. Every year during Woodson's lifetime, the association meetings were held in African American churches, community centers, colleges and universities, and high school auditoriums throughout the country. Churches were most often used because they could accommodate many people and they constituted the centers of the African American community.

In 1916, Woodson launched the first issue of the *Journal of Negro History*. By 1919, the *Journal* reached approximately 4,000 people, and there were 1,648 subscribers. While a teacher at

Armstrong Manual Training High School, Woodson published his second major monograph, *A Century of Negro Migration* (1918). Early on in the association's history, Woodson sought to popularize and democratize the study of African American history by gaining a mass following. By 1919, he began systematically organizing "Negro History Clubs."

While Woodson was laying the foundations for the early African American history movement, he was also active as a teacher of history. In 1918, Woodson became the principal of Armstrong Manual Training School, in Washington, D.C., where he advocated vocational and classical education and introduced an adult education program. From 1919 until 1920, he served as the dean of Howard University's School of Liberal Arts. He also introduced and taught black history at Howard. From 1920 until 1922, he served as a dean at West Virginia Collegiate Institute. In 1921, he published his third major monograph, *The History of the Negro Church*.

During the early 1920s, Woodson wore many hats. While an educator, he directed the ASNLH, edited a journal, and managed the Associated Publishers (founded in 1921). In 1922, Woodson published *The Negro in Our History*, the first major African American history textbook and Woodson's most popular book. By March 1941, Woodson noted that 40,000 copies of his text had been sold. By 1922, Woodson also decided to devote his life to the association. He resigned from his position at West Virginia Collegiate Institute and moved to Washington, D.C., in order to commit himself to the ASNLH.

One of Woodson's most important contributions to the early African American history movement was his transformation of African American history into a practical and popular medium for uplifting African Americans and challenging racial prejudice. He revolutionized the U.S. historical profession, in part, by popularizing the study of African American history. Within the ranks of the association, there were many different groups of people, including professionally trained scholars, schoolteachers, African American history enthusiasts, African American race leaders and representatives, and young African Americans. In adopting this approach, he did not de-emphasize the role of rigorous scholarship in the "life-and-death struggle" for

African American liberation. On the other hand, he maintained that in addition to being founded on rigorous research, the study and dissemination of African American history should extend to the working class and youth. Woodson reasoned that the knowledge of African American history was a fundamentally practical, though nonmaterial, way in which African American people could become liberated and empowered.

Between 1915 and 1950 (increasingly more by the 1920s), he strove to enlighten the African American community, popularizing African American history in a variety of ways. He extended himself as a resource and lecturer to African American communities throughout the country. He opened the doors of the association to lay historians, ministers, secondary and elementary schoolteachers, businessmen, and the African American community as a whole. In 1926, he initiated Negro History Week. By the early 1930s, Woodson called this celebration the "greatest educational work" of the ASNLH. With this "mass educational program," Woodson sought to help educate and instill racial pride within African American, introduce and integrate African American history into U.S. educational institutions, dispel racist stereotypes and prejudice within White society, and inspire African American youth. Woodson routinely warned against those who sought to profit from the celebration, stressing that the children themselves be central figures in Negro History Week events.

In 1927, a year after the founding of Negro History Week, Woodson established the association's Extension Division, exposing more people to African American history through public lectures and correspondence study. The Home Study Department was necessary, in Woodson's view, because not enough teachers were qualified to teach African American youth about their history and because "various classes of citizens" needed to know their history. While the Home Study Department did not enjoy a large enrollment, the teaching staff included leading African American scholars of the interwar period. Beginning in October 1937, Woodson began publishing *The Negro History Bulletin*, an easy-to-read African American history magazine that was created primarily for African American youth and schoolteachers as supplements for mainstream U.S. history textbooks.

Beyond popularizing African American history, Woodson was also one of the first professionally trained African American scholars to publicly critique African American intellectuals, scholars, and professionals, as well as the historically Black colleges and universities that produced them. He was also a political commentator. His columns appeared in outlets such as the Baltimore *Afro-American*. A self-proclaimed supporter of Booker T. Washington, Woodson openly indicted his African American professional and academic counterparts for not contributing as much as they could to the African American struggle. In *The Mis-Education of the Negro*, Woodson challenged African American intellectuals to be practical and to help the less fortunate, very much as Washington had urged in *My Larger Education*. In his now-famous 1933 polemic, Woodson was not turning over a new stone but rather continuing his evolution as a scholar-activist and iconoclastic thinker. In this important book, Woodson's main focus was first showing how "highly educated Negroes" had misled, exploited, and hampered the livelihood of the African American masses, and how these destructive approaches could be reversed.

Woodson's scholarship did not highlight the roles of African American women, but in the 1930s, he published several key articles on African American women. After Woodson founded Negro History Week in 1926, African American female teachers, club women, librarians, and social activists played essential roles in popularizing the study of African American history. By the early 1920s, African American women were active in the ASNLH conferences, and at the Annual Meeting in Petersburg, Virginia, in 1936, Mary McLeod Bethune was elected president of the ASNLH "to fill the vacancy" opened by John Hope's death in February 1936. Bethune, founder of Daytona Educational and Industrial Institute, served as the president of the ASNLH until 1952.

Woodson's legacy can be measured in many ways. Not only did he found Negro History Week, which laid the foundations for what we now call Black History Month, but throughout his career, Woodson also mobilized a tight circle of younger professionally trained African American historians who, despite his hardness, apprenticed themselves to him for varying periods of time. These scholars, who were born mainly during what Logan deemed

"the nadir" and took pride in calling themselves Woodson's "Boys," often ideologically departed from their mentor, but they usually put these differences to the side in order to work with Woodson in establishing African American history as a legitimate field of study, a vital and practical source of pride for African Americans, and as a cross-cultural educational reform movement. The dialogues, interactions, and relationships among Woodson and his disciples contributed to the evolution of the African American historical enterprise during a fundamental period in its maturation. These historians in turn trained succeeding generations of African American historians who helped legitimize African American history during the dynamic Black Power era. It is no exaggeration to say that today's leading African American historians, from those who came of age during the civil rights era to those socialized during the "golden age" of hip hop, were indirectly influenced by Woodson.

During an era of overt Jim Crow segregation, Woodson espoused a worldview that dictated that he make the historical craft relevant and practical by working closely with and for the rank and file of his people. He was a committed scholar-activist, an "intellectual-activist," or a "liberated intellectual."

As a member of the early to mid-20th century African American professional class, he embraced a "service ethic." For Woodson, this translated into delivering African American history to the African American masses, working class, and youth throughout the nation. From 1922 until 1950, this mission was orchestrated from his "office home" at 1538 Ninth Street, NW, Washington, D.C. Central to many 20th century African American professionals' lives, as was the case with Woodson, was service to disempowered African American people. Woodson faced many challenges while serving his clientele. Above all, he was committed to the promotion of African American history. As an underacknowledged contributor to the interwar Intercultural Education Movement and to the African American cultural consciousness movement that blossomed during the Black power era, he wholeheartedly believed that African American history was a vital medium of social reform, cross-cultural understanding within U.S. society, and African American identity formation and psychological liberation. He demonstrated that practical, effective African American leaders could and should emanate from the ranks

of professional historians, a concept that appears to have declined following the civil rights movement and continues to challenge African American historians. Carter G. Woodson's contributions to African American education, identity formation, culture, scholarship, intellectual thought, and historiography are truly remarkable.

WYGANT V. JACKSON BOARD OF EDUCATION

Wygant v. Jackson Board of Education, decided in 1986, stemmed from a collective bargaining agreement between the school board of Jackson, Michigan, and its teachers' union that provided racial preferences for minority teachers in the event that layoffs became necessary. White teachers who lost their jobs as a result of this provision filed suit, claiming that the policy impermissibly discriminated against them on the basis of race. The U.S. Supreme Court ruled in favor of the White teachers, signaling that affirmative action programs in the future would be more difficult for state and local governments to justify. This entry provides an exploration of the backstory, the facts, and the implications of *Wygant v. Jackson Board of Education*.

Historical Context

The first African American schoolteacher was hired by the Jackson School District in 1954. By 1969, or

African American representation within the district's teaching force had risen only to 3.9%. In that year, the Jackson branch of the National Association for the Advancement of Colored People (NAACP) filed a complaint to the Michigan Commission on Civil Rights, alleging that the school district had engaged in a variety of discriminatory practices, including racial discrimination in the hiring of teachers. The commission conducted an investigation pursuant to the complaint and concluded that the allegations had merit. As a result, the commission issued an order of adjustment, under which the Jackson Board of Education agreed to a number of measures to improve educational opportunities for African American public school students, including a promise to take affirmative steps to recruit, hire, and promote African American teachers and counselors.

However, in 1971, layoffs of faculty became necessary. The collective bargaining contract in place at the time gave preference to faculty with the highest levels of seniority. Because the school district had only recently implemented an affirmative action hiring plan, the provisions of the existing contract led to disproportionately large job losses among newly hired African American faculty members. The layoffs eliminated all of the gains in African American hiring that the affirmative action plan had caused to take place.

In 1972, when racial tensions escalated in the school system to the point of violence, school officials determined that the only solution to the crisis was full-blown desegregation, including desegregation of the faculty. However, they also recognized that if the collective bargaining agreement preserved the seniority-based layoff system, genuine faculty segregation could not take place. After a lengthy negotiation between the board and the teachers' union, the parties agreed to a compromise that amended the seniority layoff system. Article XII of the collective bargaining agreement stated as follows:

In the event that it becomes necessary to reduce the number of teachers through layoff from employment by the Board, teachers with the most seniority in the district shall be retained, except that at no time will there be a greater percentage of minority personnel laid off than the current percentage of minority personnel at the time of the layoff. In no event will the number given notice of possible layoff be greater than the

number of positions to be eliminated. Each teacher so affected will be called back in reverse order for positions for which he is certificated maintaining the above minority balance.

In the event of layoffs, the effect of this provision would be that some White teachers with greater seniority would be laid off while some African American teachers with less seniority were retained. The goal of the policy was not to repeat the experience of 1971, when African American teachers were disproportionately victimized by those layoffs.

Facts of the Case

When layoffs became necessary in 1974, the board, rather than enforce the requirements of the amended layoff policy, retained tenured (White) teachers and laid off probationary African American teachers, failing to maintain the percentage of minority teachers who were employed at the time of the layoffs. The union, together with the two African American teachers who had lost their jobs, filed suit against the board in federal district court. The suit alleged that the board's failure to adhere to the provisions of the collective bargaining contract with respect to the layoffs violated the Fourteenth Amendment's equal protection clause and Title VII of the Civil Rights Act of 1964.

The board, for its part, denied any previous employment discrimination against African Americans and argued that the provision in question violated the Michigan Teacher Tenure Act. The district court declared it lacked jurisdiction to rule on the matter, in part because the plaintiffs lacked sufficient evidence to prove their claim that the school board had engaged in discriminatory hiring practices and because the plaintiffs had failed to file a complaint with the Equal Employment Opportunities Commission (EEOC).

State Court Rules

The plaintiffs subsequently sued the school board in state court, making essentially the same claims. The state court ruled against the board, rejecting its claim that the layoff provision did not violate the Michigan Teacher Tenure Act. The court also found that though there had not been a judicial finding of overt racial discrimination by

the school system, the affirmative action plan was permissible because of the need to remedy the effects of "societal discrimination."

As a result of the state court ruling, the Jackson Board of Education adhered to Article XII; consequently, during the 1976–1977 and 1981–1982 school years, White teachers with greater seniority were laid off, while African American teachers with less seniority were retained. The displaced White teachers brought suit in federal district court, alleging violations of the equal protection clause, Title VII of the Civil Rights Act of 1964, and other federal and state laws. The district court ruled against the displaced teachers, arguing that the racial preferences granted by the board need not be grounded in a finding of past discrimination. Rather, the court held that the policy was permissible to remedy societal racial discrimination by providing minority students with positive role models. The Court of Appeals for the Sixth Circuit affirmed the district court's decision, largely adopting the reasoning and language of the lower court's ruling. The displaced White teachers appealed their case to the U.S. Supreme Court.

The Supreme Court Steps In

In a 5–4 decision, the Supreme Court reversed the lower court decisions. Writing for a plurality, Justice Lewis Powell argued that the layoff provision violated the equal protection clause because, as executed, it required that the teachers be laid off simply because they were White. He further maintained that whenever the government embarks upon affirmative action, it had two duties: (1) to justify racial classification with a compelling state interest and (2) to ensure that the means chosen were narrowly tailored to its purpose.

Regarding the first, Powell rejected the board's claim that racial preferences were justified because the percentage of minority students exceeded the percentage of minority teachers. At best, he continued, this scheme implied a separate-but-equal system that the Court had already repudiated in *Brown v. Board of Education*. Racial preferences had to be based on findings of prior discriminatory conduct on the part of the board, rather than claims of "societal racial discrimination."

Second, the Court concluded that the school district's remedy—layoff preferences—incorrectly addressed past discriminatory hiring practices

since “denial of future employment opportunity [was] not as intrusive as loss of an existing job.” Other less-intrusive methods (such as hiring goals) were available to the board to address past discrimination. Writing separately from the majority, Justice Byron R. White agreed that the layoff preferences for minority teachers violated the equal protection clause.

Justice Thurgood Marshall, joined by Justices William Brennan and Harry Blackmun, penned a dissenting opinion in which they chided their colleagues for too hastily concluding, in their view, that the claims of prior racial discrimination in hiring by the board had not been proved. They felt that the layoff provision in the collective bargaining contract was the legitimate result of a democratic process that the courts should not have disturbed. Justice John Paul Stevens also dissented, maintaining that the board’s goal of employing an integrated faculty advanced an important government interest that should have been permissible, despite the burdens it might impose on some White teachers in the event of layoffs.

The Impact of the Ruling

Wygant sent a signal to state and local governments that affirmative action programs would be required to undergo strict scrutiny in order to pass constitutional muster in the future. Simply arguing that because U.S. society has discriminated against African Americans in general would not be a sufficient justification for an affirmative action plan. Rather, government bodies would have to root their policies in evidence of specific histories of documented discriminatory conduct.

By vindicating the claims of the displaced White teachers, *Wygant* gave encouragement to White plaintiffs in other contexts to pursue equal protection claims based on the contention that they were the innocent victims of racial preferences designed to undo the effects of past discrimination. It also suggested that, with future appointments of additional conservatives to the federal judiciary, supporters of affirmative action should expect additional legal challenges to its constitutionality.

YOUNG MEN'S CHRISTIAN ASSOCIATION (YMCA)

Young Men's Christian Association (YMCA) is an international association of local and national associations with a membership of approximately 45 million individuals located in 124 countries. Although its original mission focused on the development of a healthy spirit, mind, and body through activities for young men that embodied Christian principles, YMCAs today serve men, women, and children. Although Christian in its origin and affiliations, the YMCA of the United States is open to people of all religious affiliations.

History of the YMCA in the United States

YMCAs were established in London, England, in 1844, to respond to dreaded social conditions in the urban areas. During the Industrial Revolution in England, young men came to the big cities to find work. Working long hours and far from home, these young men lived and worked in close proximity and became susceptible to the ills of the urban metropolis. George Williams and a group of similarly minded clerks founded the YMCA to utilize Bible study and prayer as a substitute for leisure time on the streets. Meeting for the first time in a coffeehouse in London, the founders brought the idea to life; the organization and grew to 24 chapters and 2,700 members within seven years. In that same year (1851), the YMCA concept spread to Boston, Massachusetts—the first association in the

United States. With similar urban decay occurring in the United States, especially in the northeastern cities, the idea gained traction with associations formed in New Orleans and New York City and several cities between. By 1860, there were more than 200 YMCAs in the United States.

As quickly as these earlier YMCAs were established or collectively organized, they suffered a major setback. Divided over the issue of enslavement and the Civil War, the federation of YMCAs in the United States dissolved, and the majority of the locations in the South closed. Many of the northern YMCAs reestablished their federation and built stronger ties through their collective support of Union soldiers. With the close of the Civil War, wounds between northerners and southerners healed, and a new federation with YMCAs from southern cities was soon established.

This new federation of YMCAs continued with its evangelical pursuits of young men; however, YMCA programming began to diversify. A four-fold concept—serving the intellectual, physical, social, and religious life—became prominent. Services to boys increased in importance to local associations. World War I and II brought expanded support of troops in combat. During World War I, YMCAs implemented religious, recreation, and entertainment activities for troops at home and abroad. During World War II, YMCA continued this service to troops as an affiliate of the United Service Organization (USO). Finally, the close of World War II brought services to women and girls as well as the establishment of sites outside of urban areas.

Through the next 50 years, the YMCA continued to evolve and diversify. Its ability to maintain a consistent base while continually reinventing itself has been the foundation of the organization's growth and longevity. Primarily through this adaptability, the YMCA of the USA has become the largest non-profit service organization in the United States.

YMCAs and African Americans

The remarkable aspect of African American's history with YMCAs is the fact that the first YMCA organized to serve African Americans opened nine years after the movement's founding in London, England. In 1853, Anthony Bowen, a previously enslaved African from Maryland, along with a group of colleagues, established the first African American YMCA in Washington, D.C. Leading the way for other YMCAs, Bowen's YMCA provided religious services to men and boys. Following the Civil War, other African American associations grew from New York City to Philadelphia to Charleston, South Carolina.

Although the issue of services to African Americans was an issue from the inception of the YMCA, it was finally addressed with the hiring of an international secretary in 1876 to promote association work with African Americans. This promotion took hold when emphasis was placed on establishing associations on campuses of historically Black colleges and universities. However, with little or no money, volunteer leadership, and no support from the national office, these early YMCAs struggled to maintain their existence. In 1891, the first African American international secretary, William A. Hunton, was hired. His focus on educated African American leadership, black leadership, racial solidarity, and self-help spurred the growth of these YMCAs over the next 50 years. During this period, African American YMCAs grew in size and scope. They hired local executive secretaries and program staff and constructed facilities fit to implement the fourfold program; however, the onset of the Great Depression in the 1930s slowed the expansion and closed some associations.

With the end of the World War II, African Americans protested segregationist policies of the YMCA yet relished their autonomous local associations. With increasing challenges from African American association leadership, the YMCA of

the USA in 1946 closed their "Colored Work Department," eliminated racial designations of local associations, and promoted desegregation of existing associations.

Demographics

Today, the YMCA serves approximately 21 million men, women, and children in the United States. Of the 20.2 million served, approximately 9.5 million are under the age of 17, and 11.5 million are 18 years old or older. Moreover, this membership is split evenly across genders (about 10.4 million males and 10.5 million females). These adults and youth are served in 2,686 local YMCAs across the United States. Supplementing the local YMCA professional staff, more than 600,000 volunteers provide leadership and support to the mission of these organizations.

YMCA Programs

With its national headquarters in Chicago, Illinois, the YMCA of the USA employs approximately 350 persons to provide programmatic, governance, and organizational support to its 2,686 associations. In communities across the United States, local YMCA activities are based on local wants and needs. Autonomous from the national office, local boards of directors and professional staff make local decisions on program content, staffing, and other operational issues.

Individual YMCA programs strive to achieve the vision of the organization: strong kids, strong families, and strong communities. Collectively, the local program seeks to address all three sides of the triangle in the YMCA logo representing the mind, body, and spirit. Additionally, through partnership with the Search Institute (an independent nonprofit organization with a focus similar to that of the YMCA), YMCAs develop programs through an asset-building approach. In this regard, YMCAs use their programs to infuse developmental experiences that have been demonstrated to help young people develop into caring, honest, respectful, and responsible adults.

Although each YMCA's program mix is contingent upon local interest, needs, resources, and desires of the community, YMCA programs can be categorized in the following 11 areas:

1. Aquatics and scuba
2. Arts and humanities
3. Camping
4. Child care
5. Family
6. Health and fitness
7. International
8. Older adults
9. Sports
10. Teen leadership
11. Youth and community development

Local YMCAs implement these programs in both traditional and nontraditional locations. Through local collaborations, YMCAs implement programs in elementary, middle, and high schools; homeschooling; hospitals; churches; and in conjunction with juvenile courts.

INTRODUCTION

The *Journal of Negro Education* is pleased to contribute the complete bibliography of our first 76 years of continuous publication to *The Encyclopedia of African American Education*. The bibliography was originally published in the spring 2006 issue under the leadership of Dr. Frederick D. Harper, who served as Editor-in-Chief from 2004–2008. The complete bibliography of *The Journal of Negro Education* from 1932–2006 commemorated our 75th volume year. Since spring 2006, we have published 11 issues, including 3 special issues: *Research and Its Impact on Educational Policy and Practice* in summer 2006, *Looking Beyond the Digital Divide* in winter 2007, and *Learning Communities in the Higher Education of African Americans* in summer 2008. In summer 2007, we released the Diamond Anniversary Issue of *The Journal of Negro Education*, coedited by Editor-in-Chief Emeritus Dr. Faustine C. Jones-Wilson and Dr. Veronica G. Thomas.

In the summer of 2008, Dr. Ivory A. Toldson was selected to serve as the seventh Editor-in-Chief

of *The Journal of Negro Education*. As a member of Howard University's counseling psychology faculty and senior research analyst for the Congressional Black Caucus Foundation, Dr. Toldson has led initiatives to place the *Journal* in a position to influence federal-level educational policy. As we follow changes in educational legislation under the Obama administration and the cultural changes as American society becomes more diverse and inclusive, presently the *Journal* is focused on research that provides solutions for the persistent achievement gaps between races, the education of Black people in the Diaspora, interdisciplinary educational research, and research that celebrates our legacy and builds on strengths instead of focusing on deficits. *The Journal of Negro Education* will continue to be "a Howard University quarterly review of issues incident to the education of Black people."

Ivory A. Toldson

Editor-in-Chief

The Journal of Negro Education

The Journal of Negro Education is published under the auspices of the School of Education, Howard University, Washington DC 20059. The bibliography and reprinted articles in this appendix are copyrighted by Howard University and are included here by permission. Further information about the journal is available on its Web site: <http://www.journalnegroed.org>.

Full-text articles from *The Journal of Negro Education* are available from JSTOR, at <http://www.jstor.org> through participating libraries. JSTOR is a not-for-profit organization dedicated to creating and preserving a digital archive of scholarly journals.

EDITOR'S COMMENTS

THE COMPLETE BIBLIOGRAPHY OF *THE JOURNAL OF NEGRO EDUCATION*, 1932–2006

As the spring 2006 issue, *The Journal of Negro Education (JNE)* is pleased to publish the complete bibliography of all articles printed in *The Journal* since its founding in 1932. When I assumed editorship of *The Journal* in 2004, one of my goals was to develop a bibliographic listing of all published *JNE* articles by year, volume, and issue. The major purpose of developing the bibliography was to provide a valuable reference source for research and teaching. Failing to receive a small grant to carry out the project, *The Journal* staff agreed to carve out time to produce the bibliography. All staff members, including the Editor-in-Chief, participated in typing, proof-reading, and formatting what has become the content of this special publication.

To a degree, the bibliography chronicles historical and educational developments of people of African descent in the U.S. and other sectors of the world over a span of more than 74 years. During these years, *JNE* articles have documented events, published survey results and other research findings, promulgated theoretical and philosophical thoughts, profiled outstanding educational leaders and scholars, and discussed legislative acts and judicial decisions as related to the education and welfare of Black people. Moreover, as a significant archive and contribution to Black studies, *JNE* articles, over the years, have documented important events of Black history and the various conditions of race relations throughout the world (e.g., see Bunche, 1934, 1940, 1950; Du Bois, 1941, 1946; Logan, 1946, 1955; May, 1937).

The Journal of Negro Education began publishing during a time in U.S. history when there were very few Black, scholarly journals. Furthermore, this was a time when traditionally White journals very often excluded articles related to Black people, or they tended to publish racially biased and negative articles regarding Blacks. Therefore, *The Journal of Negro Education* filled a void and became a major forum for articles by and/or about Black people.

Over the decades of its existence, *The Journal* has published articles by some of America's eminent leaders, literary figures, and educational scholars—both Black and non-Black authors. In addition, it has published works of authors from Canada and numerous countries in Africa, Asia, Europe, and the Caribbean. Presented in Table 1 by name, year of publication, and number of articles are fine examples of distinguished Black scholars who authored or coauthored three or more articles in *The Journal of Negro Education* during its earlier decades (1930s through the 1960s). As noted in Table 1, these outstanding *JNE* authors include Horace M. Bond, Ralph J. Bunche, Kenneth B. Clark, W. Montague Cobb, W. E. B. Du Bois, John Hope Franklin, E. Franklin Frazier, Charles H. Houston, Charles S. Johnson, Alain L. Locke, Rayford W. Logan, Benjamin E. Mays, Frederick D. Patterson, Dorothy B. Porter, and Robert C. Weaver. Other notable Black scholars who authored or coauthored in the *JNE* during this time period include James A. Bayton (1942, 1949),

Table I Eminent Authors Who Published Multiple Times in *The Journal of Negro Education* by Name, Year of Publication, and Number (N) of Articles Published

<i>Name</i>	<i>Year of Publication</i>	<i>N of Articles Published in JNE</i>
Horace Mann Bond	(Bond, 1932, 1935a, 1935b, 1937a, 1937b, 1938, 1939, 1941, 1943, 1945, 1947, 1948, 1950, 1952, 1958, 1959, 1960, 1961; Johnson & Bond, 1934)	19
Ralph J. Bunche	(Bunche, 1934, 1935, 1936a, 1936b, 1939, 1940, 1941, 1950)	8
Kenneth B. Clark	(Clark, 1943, 1959, 1967, 1988; Clark & Clark, 1950)	5
W. Montague Cobb	(Cobb, 1934, 1939, 1949, 1951, 1958)	5
W. E. B. Du Bois	(Du Bois, 1932, 1935, 1936, 1938, 1939, 1940, 1941, 1943, 1946)	9
John Hope Franklin	(Franklin, 1948, 1956, 1957)	3
E. Franklin Frazier	(Frazier, 1933, 1935, 1936, 1939, 1940, 1944, 1950, 1961)	8
Charles H. Houston	(Houston, 1935, 1938, 1943)	3
Charles S. Johnson	(Johnson, 1935, 1936, 1939, 1940, 1941, 1942, 1943, 1944a, 1944b, 1944c, 1949, 1951, 1954, 1957; Johnson & Bond, 1934)	15
Alain L. Locke	(Locke, 1935, 1939, 1944a, 1944b, 1945)	5
Rayford W. Logan	(Logan, 1933, 1940, 1941, 1946, 1955, 1958, 1961, 1963)	8
Benjamin E. Mays	(Mays, 1933, 1937, 1940, 1942, 1945, 1950, 1952, 1959, 1960)	9
Frederick D. Patterson	(Patterson, 1936, 1942, 1952, 1955, 1958, 1960, 1966; Trent & Patterson, 1958)	8
Dorothy B. Porter	(Porter, 1936a, 1936b, 1943, 1952, 1963)	5
Robert C. Weaver	(Weaver, 1938a, 1938b, 1942, 1943, 1944, 1947, 1950, 1953, 1956, 1960a, 1960b, 1960c; Weaver & Gabel, 1957)	13

Sterling A. Brown (1933, 1939), Allison Davis (1939), Arthur P. Davis (1962), Dorothy I. Height (1945), Thurgood Marshall (Marshall, 1952, 1957; Carter & Marshall, 1955), A. Philip Randolph (1936), Lucy Slowe (1933), Arthur B. Spingarn (1938), and Clemmont E. Vontress (1966, 1968, 1969).

Among eminent White authors who published in *The Journal of Negro Education* during its early decades were Nobel Prize novelist, Pearl S. Buck (1942);

former University of Chicago President, Robert M. Hutchins (1941); and former First Lady, Eleanor Roosevelt (1934), who listed her authorship as Mrs. Franklin D. Roosevelt.

In recent decades, since 1970, *The Journal* has published articles by scores of notable authors, who are too numerous to name in the space of this editorial. However, some of these *JNE* authors who pioneered their scholarly areas of interest or who have broad professional recognition include Molefi Kete Asante (1991), James A. Banks (1979, 1995), Andrew Billingsley (1982), A. Wade Boykin (1984), Johnnetta B. Cole (2001), James P. Comer (1989), Lisa D. Delpit (1992), Jacqueline Fleming (1981), Mary Hatwood Futrell (1999), Edmund W. Gordon (1985), Asa G. Hilliard (1983, 1992), Jacqueline Jordan Irvine (1999), Joyce A. Ladner (1987), Gloria Ladson-Billings (1991, 1998), Beverly Lindsay (1980, 1994, 2004), Harriette Pipes McAdoo (1991), John U. Ogbu (1990), Alvin F. Poussaint (Poussaint & Atkinson, 1968), Mwalimu J. Shujaa (1992), and Charles V. Willie (1987, 1994, 2000).

Some of the classic articles published in *The Journal of Negro Education*, since its founding, include Clark and Clark's (1950) study of Black children's preference for White vs. Black dolls, research that contributed to the Supreme Court's *Brown v. Board of Education* (1954) decision. Moreover, there is Du Bois's (1935) often-quoted article that discusses the pros and cons of "separate" Black schools versus "mixed" schools (p. 328). In addition, there is Ralph Bunche's (1940) call for Blacks in academia to be "public intellectuals" and, thus, have a positive influence on moral and political issues that are relevant to Black people. In *The Journal's* recent special issue on Ralph Bunche, celebrating the centenary year of his birth, Holloway (2004, p. 130) states, ". . . Bunche believed that intellectuals and universities had an extremely important role to play in shaping the public's morality and politics."

In addition, *The Journal* has published numerous themed issues (special issues, special focus issues, and yearbooks) that are identified within this bibliography. A few examples of these *JNE* special publications, by theme, include hip-hop, rap, and oppositional culture (summer, 2005); special education and the achievement gap (fall, 2005); Ralph J. Bunche and education (spring, 2004); commercialism and youth (fall, 2003); juvenile justice (summer, 2002); recruiting, preparing, and retaining qualified teachers (summer, 1999); education in South Africa (fall, 1997); education of children in a violent society (summer, fall, 1996); Black males and education (winter, 1992; fall, 1994); racism and education (spring, 1991); mathematics, science, and technology (summer, 1990); Head Start (winter, 1989); Black language, Ebonics, and education (winter, 1983; winter, 1998); Black women and education (summer, 1982; summer, 2001); assessment and testing (summer, 1980; summer, 1986; summer, 1998); *Brown v. Board of Education* on its 40th and 50th anniversaries (summer, 1994; summer, 2004); Black studies (summer, 1984); Africentrism and multiculturalism (summer, 1979; summer, 1992); urban education and schools (summer, 1975; summer, 1988); international education as related to the Black Diaspora (summer, 1941; summer, 1946; summer, 1961; summer, 1987); equal educational opportunity (summer, 1968); racial desegregation (summer, 1954; winter, 1978); health status and health education (summer, 1937; summer, 1949); leadership and higher education (summer, 1933; winter, 2004).

In developing this bibliography, we learned a number of things that are worth bringing to the attention of *JNE* readers. For example, upon realizing that punctuation and terminology have changed over the decades, we held in almost all cases to remain true to the actual punctuation and language of the titles as printed. For

example, in publications of the early decades, authors tended to use a dash, instead of a colon, to separate the main title of an article from the subtitle. Also, in a series (seriation) of three or more items within a sentence, a comma was often omitted before “and,” which is unlike today’s formal writing of U.S. English. Moreover, the *Publication Manual of the American Psychological Association*, as we know it today, did not exist during the early period of *JNE* publishing, and it was not adopted as the publication style for *The Journal* until 1990 (see the current or 5th edition of the manual, American Psychological Association, 2001).

In several cases, while developing the bibliography, the *JNE* staff found that the titles and page numbers of articles printed in the table of contents did not match up precisely with those on the actual title page of the article or the actual pagination of the article. For example, a word or spelling of a name varied or a page number was off by one digit. Although such cases were very rare and expected in decades of published journal issues, the *JNE* staff adopted a rule to use bibliographic information from the title page of the printed article and the actual beginning and ending page numbers from the printed article. In other words, we relied on the printed text of articles and not the table of contents of issues or electronic copies of articles from the Internet.

The development and presentation of this bibliography is only a beginning toward exploring what has been published in *The Journal of Negro Education* and what is available for research, teaching, and learning. It is our purpose to update this document from time to time as new articles are published. Moreover, we plan to carry out qualitative content analyses of the articles in the bibliography by various categories such as by topic, author/s, educational context, educational level, period or time of publication, geographic area of focus, and method of research, among other categories of analysis.

I cannot conclude this editorial without mentioning that *The Journal of Negro Education* could not have existed in perpetuity for more than 74 years without the budgetary support of Howard University; the administrative/faculty support of its School of Education; and the dedicated, persevering, and unselfish work of *The Journal*’s Editors-in-Chief and staff over these years. As we showcase the totality of published work in *The Journal*, it is appropriate to acknowledge those who toiled for years to make *The Journal* go and to keep it in print. Foremost, the founder and first Editor-in-Chief, Charles H. Thompson, served admirably in this capacity for 31 and one-half years (1932–1963). Faustine C. Jones-Wilson, the fifth and second-longest-tenured Editor-in-Chief, served for a total of 13-plus years (1978–1992). Other Editors-in-Chief who served unselfishly and made unique contributions to the publication of titled articles in this bibliography and the ongoing promulgation of *The Journal* include Walter G. Daniels (1963–1970), Earle H. West (Acting Editor-in-Chief, 1970–1973), Charles A. Martin (1973–1978), Sylvia T. Johnson (1993–2001), and Rc Saravanabhavan (2001–2004).

It is noteworthy to acknowledge two Associate Editors who each labored for 10 years or more in the editorial production of manuscripts into articles and the perpetual assurance of *JNE*’s scholarly integrity. These two persons are Theresa A. Rector and Kamili Anderson. Theresa Rector worked for *The Journal* a total of 27 years, initially as Assistant Editor and most of her years as Associate Editor/Business Manager (Jones-Wilson, 1988). Kamili Anderson served as Associate Editor/Business Manager for 10 years. In addition, Heather H. Austin served three years as Associate Editor and the late Mahmoud Gudarzi was employed 18 years as Circulation Manager/Editorial Assistant.

Lastly, I take this opportunity to acknowledge *JNE* staff members who contributed to the development of this bibliography during the 2004–2006 work period of the project. These full-time, part-time, and graduate student contributors include Abraham Owusu-Afriyie (part-time Computer Tech Specialist, 2004–2006), Michael Guilbault (Graduate Assistant, 2005–2006), Lenda P. Hill (Associate Editor, 2004–2006), Sharlene R. Jacobs (Graduate Student Office Assistant, 2004–2005), Selena Jones (McNair Graduate Assistant, 2005–2006), Cynthia Joseph (Administrative Secretary, 2006), Yvonne N. Langdon (Graduate Assistant, 2004–2005), Octavia McGill (Graduate Student Research/Marketing Assistant, 2005–2006), Temika Michael (Research Assistant, summer, 2006), and Marjorie B. Wiltshire (Research Assistant/Office Manager, 2004–2005; Marketing Consultant, 2006).

**The Complete Bibliography of *The Journal of Negro Education*,
1932–2006**

Editor’s Comments

- The Complete Bibliography of *The Journal of Negro Education*, 1932–2006**
Frederick D. Harper

New Millennium Years:

Achievement gaps, research, commercialism, juvenile justice, affirmative action (2000–2008)

“It Takes a Whole Village” Years:

Africentrism/Afrocentrism, multiculturalism, diversity, preparing teachers and students (1990–1999)

Educational Development Years:

Urban education, teacher reform, assessment and testing (1980–1989)

Racial Identity and Black Consciousness Years:

Black studies, Black language, school desegregation, racial discrimination, education in Africa (1970–1979)

Civil Rights Movement Years:

College desegregation, equality in education, protest on the White university campus, racial minorities and education (1960–1969)

Desegregation Years:

School and public desegregation, U.S. Supreme Court decisions, juvenile delinquency, race discrimination and voting in the South (1950–1959)

World War II and Post-War Years:

World War II and its impact on education, post-war and adult education, race relations, higher education, international education in Africa and beyond (1940–1949)

Early Charles H. Thompson Years:

Health status and health education, survey reports on Black schools and colleges, impact of the Depression era on Black education (1932–1939)

CHAPTER XII

A Critique: The Courts and the
Negro Separate School

NEWTON EDWARDS

INTRODUCTION

This summary attempts to do two things: (1) to restate the contents of the Yearbook, chapter by chapter, in sufficient detail to enable the hurried reader to get a general idea of the content of the book; and (2) to make a somewhat critical evaluation of the Yearbook as a whole.

GENERAL SUMMARY

Plan of Organization

The Yearbook is divided into five parts. In Part I an attempt is made to define the problem of the Negro separate school more comprehensively than it has been defined heretofore. The purpose of Part II is twofold: (1) to describe the status of the separate school as defined by legislation and court decisions; (2) to point out the types of cases which have resulted in decisions favorable to the separate school and to indicate the types of cases which in the future may reasonably be expected to result in favorable decisions. Part III is a symposium on the issue: Should the Negro resort to the courts as a means of remedying the abuses of the separate school? Part IV consists of a critical summary. Part V is a selected, annotated bibliography of cases relating to the separate school and to other issues in which Negroes have been interested.

The Status of the Negro in the American Social Order

Frazier, in Chapter I, traces the development of the status of Negroes in American society. He differs sharply with those sociologists who draw a distinction between the forces which determine the social status and the economic status of an individual or group. In fact, the major thesis of this chapter is that the status of the Negro in the American social order has been, is, and will be determined, in the main by his position in the economic structure.

Before 1860, the status of the Negro was determined by the conditions of tobacco and cotton culture. During the period of reconstruction, representatives of Northern industry and finance were primarily interested in the Negro because they could use him to make secure their victory over the agrarian interests of the South. They extended to the Negro equal political and civil status in order to win his support for the Republican party which represented the interests of the expanding capitalism of the North. As soon, however, as the planter class was completely broken and power had passed unmistakably into the hands of the capitalistic class, the North abandoned the Negro and permitted the South once more to determine his status.

RESORT TO COURT: CRITICAL SUMMARY

443

During the two decades following the withdrawal of federal troops in 1877, the South worked out a social pattern to which the Negro was forced to conform by law and custom. Legislation requiring separation of the two races in a number of social relations was designed to fix the status of the Negro in the social order. Such legislation was not motivated by a desire to prevent an intimacy which was physically repulsive; it was designed "to keep the Negro in his place." Legislation was not necessary to enable the whites to keep the Negro in poverty and to exploit him to their own economic advantage. Other means were at hand to accomplish these ends. Thus in the social pattern prescribed for him by law and custom, the Negro was neither a slave nor a free citizen.

The pattern of race relations which was defined in the late 90's has continued to the present without any fundamental changes, although there are signs that the status of the Negro is losing its purely racial character and is being tied into the struggle of both white and black laborers against white landlords and capitalists. There is noticeable, too, a growing bi-racialism in the South; that is to say, the distinction between the races may be indicated by a vertical rather than a horizontal line. Many Southern liberals favor this bi-racial conception of race relationships, but Frazier feels that its significance is much overrated. People who compose interracial committees either lack the power or do not care to effect any fundamental change in the status of the Negro. The status of the Negro in the South is, as it always has been, determined

by his economic dependence. For a while it was believed by some that the Negro could emancipate himself from economic dependence upon the whites by building up "a separate economy behind the walls of segregation," but the fallacy of this belief has become apparent.

There is going forward a rapid urbanization of the Negro. In 1930, 43.7 per cent of the Negro population was living in cities as compared with 22.7 per cent in 1920. This urbanization is tending to weaken the controls over the Negro both North and South. More important than that, the Negro is beginning to realize that the "good will" of sentimental whites will not help him, that his status in final analysis is based upon economic and social power. In his new urban environment the Negro is beginning to show signs of understanding the struggle for power between labor and capital and a willingness to strike hands with white workers in an effort to achieve economic emancipation.

*Tactics and Program of
Minority Groups*

Bunche, in Chapter II, points out some of the basic factors which lead to group conflict in society, and analyzes the tactics which the Negro has employed or may employ in an attempt to improve his status.

It is seemingly a basic fact that group antagonisms inevitably arise where two groups having readily distinguishable racial and cultural characteristics are required to live in close contact with each other and are also forced into sharp economic competition. So basic is this fact that it is questionable whether a democracy

can be built up where blacks and whites are present in significant numbers in the same community. At any rate, in the world today democracy has become a tool of the dominant white population to keep the blacks vigorously suppressed. It is not to be assumed, however, that democracy *per se* has failed, or that blacks and whites can not mix amicably on a common political and economic basis. Modern democracy is the product of middle-class revolutions, and has been made to serve the interests of the capitalistic interests which fathered it. Democracy, rarely extended to blacks at all, has been extended to the masses of the working class only so long as they refrained from using it as a threat to the control of society by the ruling classes.

Negro leaders have traditionally stressed the element of race; they have attributed the plight of the Negro to a peculiar racial condition, and they have worked to eliminate "discrimination against the race." They have overlooked the fact that economically the interests of the Negro are in reality identical with those of the peasant and proletarian classes of the country. Until this common economic interest is recognized it will be impossible to modify the racial attitudes of the masses of the dominant population.

The tactics which Negro leaders have considered or have employed in improving the status of their people may be enumerated as follows: racial separation, economic passive resistance; economic separation; civil libertarianism; interracial conciliation, and appeal to the courts. Racial separation as represented by the Garvey

back-to-Africa movement is expressive of a defeatist philosophy and is, moreover, entirely impractical. Likewise nothing can be gained from a policy of economic passive resistance. Such a program could not long withstand the resistance which would be launched against it by the business leaders of the country. Similarly, any attempt to establish "an independent and segregated black economy" seems clearly doomed to failure. Such an economy could develop only with the aid and sufferance of the white world which controls credit, basic industry, and the state as well. Civil libertarianism implies the use of political action to secure social and economic justice. Far too great faith has been placed in the instruments of government as means of securing social and economic equality. Certain Negro leaders have been inclined to overlook the pertinent fact that all political institutions, all instruments of the state, merely reflect the political and economic ideology of the dominant group and that "the political arm of the state cannot be divorced from its prevailing economic structure whose servant it must inevitably be." It follows, therefore, that the Negro can secure no greater rights under the constitution than the dominant group in society is willing that he should have. "In other words, this charter of the black man's liberties can never be more than our legislatures, and, in the final analysis, our courts, wish it to be. And, what these worthy institutions wish it to be can never be more than what American public opinion wishes it to be." Efforts at interracial conciliation can result at best in only petty gains. This is true

RESORT TO COURT: CRITICAL SUMMARY

445

because those who are engaged in developing better interracial relationships can ill afford to be aggressive; they are necessarily forced to adopt a policy of conciliation; their action is circumscribed by the dominant mores. "In other words, they play cricket." Little, too, may be expected from an appeal to the courts. In the first place, the courts, like legislative bodies, merely reflect the popular will. Even court decisions which are contrary to popular opinion can not be enforced. More important than that, however, is the fact that the status of the Negro is fixed by the economic order. It is utterly fallacious to suppose that revolutionary changes in the economic order can be effected by court decisions. Moreover, it is clearly evident from numerous cases that with respect to the Negro the Supreme Court of the United States is disposed to acquiesce in the prevailing attitudes of the dominant population. Although Negro leaders should not delude themselves by expecting a great deal from resort to the courts, they should not relent in a determined fight to gain whatever can be gained in this way.

Bunche's final conclusion is that the only hope for any fundamental improvement in the condition of the masses of any minority group is the hope that can be held out for the improvement of the masses of the dominant group. The basic interests of the two groups are identical; their programs and tactics must be identical.

*Extent and Character of
Separate Schools*

Bond, in Chapter III, indicates the extent to which the separate school

prevails in the United States. He describes in a general way the inferior character of separate schools for Negroes and attributes this inferiority to the fact that the Negro school is merely a symbol of social and economic status.

School authorities in nineteen states and in the District of Columbia are required by law to maintain separate schools for white and Negro pupils. In three other states the school authorities may, at their discretion, provide for separate schools. In twelve states separate schools are prohibited by law, and in fourteen states the law is silent on the subject. There is the greatest variety of practice with respect to the enforcement of the law. In Northern states segregation is not infrequently found even though the law positively prohibits it. Segregation is by no means a sectional or geographical phenomenon.

In the Southern states there "is an undeniable inequality in the existing separate systems." This inequality is perfectly evident whatever index of efficiency may be employed. There is inequality with respect to length of school term, salaries, training of teachers, buildings, and equipment. There seems to be an inescapable tendency for the separate Negro school to become inferior. Separate school systems in the South began with an assurance of equality, and for a decade this equality was substantially maintained. There has been, nevertheless, a progressive disparity in the educational opportunities afforded by the two systems. There is evidence to indicate that much the same pattern is being developed in those Northern cities which have

adopted the policy of segregation in the schools. In other words, inequality for the Negro schools seems to be an almost inevitable feature of separatism.

The reason for this inevitable inferiority is that the separate school is an instrument of policy in the hands of the dominant group. It is a mere symbol of more important maladjustments in race relations. Bond concludes his discussion with the following significant statement. "Whether we accept the separate school as an inevitable *fait accompli*, and try to make the best of it; or whether we refuse to accept it, and intend to devote all of our energies to fighting it; these alternatives should be linked to our attitude toward our existing social and economic system, and be consistent with it."

*Does the Negro Need
Separate Schools?*

Du Bois, in Chapter IV, discusses in a very realistic way the problem of policy which the Negro should pursue with respect to the separate school. He urges vigorously that Negroes adopt the policy which will result in the most adequate education for the race. Ideally, youth of both races should be educated in mixed schools characterized by the absence of race prejudice and discrimination. Schools of this type would afford a more natural basis for the education of youth, would provide wider contacts, inspire greater self-confidence, and suppress the inferiority complex. Practically, however, Negro leaders may as well recognize the utter impossibility of realizing this ideal within this or, for that matter, the next generation.

Du Bois leaves the reader in no doubt of his reasons for believing that it is impossible at any time in the near future to develop satisfactory mixed schools in this country.

The belief that race prejudice is decreasing is entirely unfounded; as a matter of fact there is, among the whites, a growing animosity toward the Negro. Race prejudice as it exists today makes it impossible for most Negroes to receive a proper education in institutions designed primarily for white youth. Negroes who enter such institutions are not educated; "they are crucified" by the attitudes of intolerance and animosity to which they are subjected. Under such circumstances there is no question as to whether the Negro needs separate schools; he will either have them or he will not be educated. In any particular instance the Negro's attitude toward separate schools should be determined by the temper of the community. Where prejudice and animosity prevail, separate schools are preferable; where they do not prevail, mixed schools are to be desired. It is "a silly waste of money, time, and temper" to try to compel by law a powerful majority to do what it is determined not to do.

Facing the facts as they are, the Negro must change definitely and absolutely his customary attitude toward the separate school. That attitude has been almost invariably one of disparagement. Negroes commonly look down upon their own schools; they hold Negro teachers in contempt; and they are little disposed to pursue measures designed to improve the separate school. There are two reasons for such an attitude: (1)

RESORT TO COURT: CRITICAL SUMMARY

447

there is a fear that any movement to improve the separate school will result in a surrender of principle; and (2) Negroes have a genuine lack of faith in their own race. Du Bois hesitates to surrender the principle of mixed schools; he is still more hesitant to adopt a policy which will thrust Negro children into white schools where they are not wanted, "into hells where they are ridiculed and hated." The only realistic policy for the Negro to pursue is to abandon the effort to establish mixed schools except in those communities where public opinion is favorable, and devote his energy to developing separate schools in which Negro youth will receive sympathetic and intelligent tuition. Negroes in America must be inspired with a greater faith in their race and with pride and enthusiasm for their educational institutions. In short, Negroes should abandon their indifferent attitude toward the separate school and press vigorously for its improvement.

Du Bois does not rest his arguments for the separate school on negative considerations alone; there are certain positive reasons for the maintenance of separate institutions. Negroes in America have their history, their group experiences and memories, their particular culture which demands a certain type of education for its development. Negroes need a type of history which they seldom get in institutions designed for whites. Moreover, there is a need for the study of anthropology, biology, psychology, and the social sciences from the point of view of the colored races.

It should be pointed out that

throughout his discussion Du Bois makes it perfectly clear that he is not pleading for segregated schools as an ideal arrangement. His chief concern is for the proper education of the Negro. American society being what it is, Negro youth stand a better chance of getting a "proper education" in segregated schools than in mixed schools.

*Psychogenic Hazards of Segregated
Education of Negroes*

Long, in Chapter V, attempts to classify the concept of segregation "by definition, by a summary of opinions, by examination of the underlying causes, and by brief review of researches on the problem." He then turns to his major problem, that of pointing out the psychogenic hazards implicit in segregation in general and in the separate school in particular. He discusses the influence of segregation with respect to incentives, inferiority feelings, superiority feelings, racial self-appreciation, and the democratic ideal.

Segregation necessarily results in the weakening of incentives. When an individual has to look forward to life apart from the general populace and in a society of limited choice and opportunity, regardless of ability, ambition is chilled in the embryo. Mediocrity becomes an accepted standard. The segregated school inescapably forces a sense of limitation upon the Negro child.

Feelings of inferiority which are produced by segregation result in the adoption of eight mental mechanisms of adjustment. These fall into two well defined classes: (1) mechanisms

involving yielding or flight; and (2) mechanisms involving protest. The former class includes fantasy, bulkhead, regression, ostrich, and mysticism. Fantasy, of course, opens up a wide vista of possible compensations. The baffled individual, by taking flight into the unreal, is able to escape, in part at least, the adversities of the actual. A proscribed group may easily become so given to fantasy that it gets out of touch with reality. Bulkhead is the mechanism whereby one closes one's mind to a rational consideration of beliefs which may result in mental discomfort. There is evidence that this mechanism operates among Negroes. It results in the inhibition of rational self-criticism. Regression is the mechanism employed when one falls back upon juvenile or infantile responses in the face of difficulties. White persons often look upon the Negro as childish. This conception of the Negro is no doubt due to the fact that regression is often evident in the behavior of Negroes when in the presence of white persons. By the mechanism of ostrich one is able to attain a forgetfulness of tomorrow while indulging in the pleasures of the present. The ostrich mechanism permits a partial escape from reality by indulgence. Mysticism is based upon a blind faith that things will come out right. Like the other mechanisms it is essentially a retreat from reality. It is manifest in the hopefulness so often evident in the Negro.

Mechanisms involving protest may be defined as projection, rationalization, and catharsis. Projection occurs where one derives satisfaction from

blaming one's shortcomings on something or somebody other than one's self. "Rationalization is an attempt to satisfy one's self by giving more or less plausible self-deceiving reasons for one's acts or condition." Catharsis is the process of purging one's system by speaking one's mind freely.

Just how these mechanisms of behavior are related to the segregated school is not definitely and specifically known. It is a fact, however, that "the segregated school is the state's or community's affirmation of conditions out of which these feelings spring."

The segregated school, moreover, creates feelings of superiority in the white child; it discourages racial self-appreciation on the part of the Negro; and it is contrary to the democratic ideal.

*Status of the Negro Separate
School as Defined by
Court Decisions*

In Chapter VI Peterson makes a very complete analysis of the court decisions relating to separate schools for Negroes. She has two distinct purposes in mind: (1) to determine to what extent litigation since 1865 has resulted in decisions favorable to the Negro separate school; (2) to indicate the types of cases which have resulted in favorable decisions in the past and which are most likely to result in favorable decisions in the future.

Since 1865 the state and federal courts of this country have decided 113 cases involving some issue with respect to the educational rights of Negroes. In 49 cases, or 43 per cent of the total number decided, the decision of the court was such as to confer some advantage upon the Ne-

RESORT TO COURT: CRITICAL SUMMARY

449

gro public school. In 64 cases, or in 57 per cent of the cases, the decision may be considered as lost in that no advantage accrued to Negroes. It should be pointed out in this connection that in a number of instances the cases classified as lost were lost merely because the wrong action was brought. These cases may or may not have been decided favorably to the Negro if they had been decided on the merits of the issues involved. It should be noted, too, that the evidence seems to indicate little, if any, relation between geographical areas and favorable court decisions. The issue involved rather than the state in which the action is brought seems to be the determining factor.

Cases in which the educational rights of Negroes have been the subject of adjudication may be divided into five categories according to the issue involved: (1) cases which contest segregation in the absence of any constitutional or statutory provisions on the subject; (2) cases which contest discriminatory taxation; (3) cases which contest the constitutionality of segregation; (4) cases which contest the legality of unequal educational opportunities; and (5) cases which attempt to prevent the exercise of arbitrary power.

In fourteen states neither the constitution nor the statutes make any reference to race segregation in the schools. In nine of these states cases have been decided in which the authority of local school boards to maintain separate schools was the issue involved. In every case it was decided that in the absence of constitutional or statutory authority a local board of education cannot main-

tain separate schools. Peterson concludes, therefore, that the law is well settled where issues of this kind are involved.

A number of cases have been brought to contest the constitutionality of legislation which provides that revenue derived from a tax on white persons shall be applied to the support of schools for white children and revenue derived from a tax on colored persons be applied to the support of schools for colored children. Such legislation has been held unconstitutional in Georgia, Kentucky, Mississippi, North Carolina, and Oklahoma, the only states in which the issue has been carried into the courts.

Numerous decisions of state and federal courts have established without question the principle that a statute authorizing or requiring separate schools is in no way violative of the Constitution of the United States. On this point all the courts are in accord. The courts are all agreed, however, that where separate schools are maintained the children of the two races must be afforded substantially equal educational opportunities.

In numerous instances existing educational arrangements have been challenged on the ground that colored pupils were being denied equal educational advantages. The plaintiff was successful in only nine of the twenty-eight cases of this type. With respect to the possibility of winning a case where the issue of equal educational advantage is involved, Peterson comments as follows: "If . . . the facts show that the advantages offered in the separate school are grossly inferior, or hazardous, and that the lack suffered is a lack in educational

facilities rather than social facilities, then the case is likely to be decided favorably for the cause of the separate school. But, if on the other hand, the facts show the educational facilities to be substantially equal to those for white [children], the case will very probably be unfavorably decided."

Types of Cases Potentially Favorable to the Separate School

Hubbard and Alexander, in Chapter VII, review in considerable detail cases decided by state and federal courts with the view of discovering just what types of action may reasonably be expected to result in decisions favorable to the separate school. In those states where either the constitution or the statutes prohibit the maintenance of separate schools, the only remedies available are to be found in the laws of the state involved. Unless it can be shown that the educational opportunities afforded colored children are substantially inferior to those afforded white children, there is no point in appealing to the federal courts.

In those states which authorize or require the maintenance of separate schools by constitution or statute, there may be a remedy to prevent an unequal distribution of school funds. The authors examine in a good deal of detail the statutes governing the distribution of school funds in certain of the Southern states. They discover the following methods of distributing the school funds.

1. Where the statutes provide for a proportionately equal division of available funds among the counties or school districts according to some precise method or formula which if followed would in fact produce

a proportionately equal division of these funds. . . .

2. Where the statutes provide for a distribution of the funds to be made by a certain officer or board but specifies no rule or standard to guide the officer or board in making the division. . . .

3. The third situation arises where the statutes provide that the proper officials "shall make a fair and equitable division of the funds" but furnishes them no rule or requirement by which this is to be done. . . .

4. In the fourth situation the law gives to the voters of particular counties or school districts, the power to either vote down taxes, which would be used to support Negro schools, or to specify that certain taxes, which they pay, shall be used only for white schools.

Where funds are being distributed by methods described in the first situation, two remedies are suggested: (1) mandamus or injunction proceedings in the state courts in order to secure a proper enforcement of the law; (2) proceedings in a federal court to enjoin the action of the state officials on the ground that their action is in violation of the Fourteenth Amendment. In this connection a number of decisions of the United States Supreme Court are discussed in order to show that the court interprets the prohibitions of the Fourteenth Amendment as being broad enough to include the illegal acts of a state official in case those acts deprive a citizen of the equal protection of the law. Where funds are distributed according to the second, third, and fourth methods as described in the preceding paragraphs, the only remedy is to appeal to the protection of the Fourteenth Amendment. Cases are again cited to show that the Supreme Court of the United States may be expected to declare unconstitutional a statute which confers unlimi-

RESORT TO COURT: CRITICAL SUMMARY

451

ted discretion upon administrative officials.

Two methods of procedure are recommended. The first of these is to bring action in equity to enjoin local school authorities from maintaining separate schools for colored children. One ground for such an action should be that the statutes by which the funds are to be raised for these schools are violative of the Fourteenth Amendment, in that they confer upon the local school authorities an unlimited discretion in the distribution of the funds. These statutes should also be attacked on the ground that they result in discrimination against the colored schools. A second procedure would be to institute mandamus proceedings in the state courts to compel admission of colored children to the schools for white children. The bases for proceedings of this kind would be the same as would be urged in the federal courts to enjoin the maintenance of schools for colored children.

The Dilemma of Segregation

In Chapter VIII, Locke raises the issue as to whether the Negro's attitude toward segregation should be governed by the short-term or the long-term point of view, by expediency or principle. He leaves the reader in no doubt with respect to his own position. He recognizes that certain private schools for Negroes have vested interests in segregation, but he foresees the time when many such institutions will find it necessary to close in order to force upon the community the assumption of its proper duty. He recognizes, too, that segregated schools afford opportunity

for "careers" for Negro teachers and administrators, but these "temporary and short-sighted gains" count for little. The separate school permits of no automatic or gradual improvement; gradualism is a mistaken policy. Moreover, it is utterly fallacious to suppose that schools for the two races will ever afford equal opportunities as long as they are separate. In short, the only rational policy for Negroes to pursue is to fight segregation vigorously and to do it by appeal to the courts.

Resort to Courts by Negroes a Conditional Alternative

In Chapter IX, Kilpatrick points out certain elements in our social life which need to be taken into consideration before making an immediate and vigorous appeal to the courts as a means of securing equal educational opportunities for Negroes. It is a fundamental consideration that court decisions, as well as laws in general have to be enforced by public sentiment. If outside agencies attempt to enforce a decision or a law which receives little support in a locality, there is danger of resort to violence and cruelty. A second consideration is the influence of historical tradition. In the South, between the white man and the Negro there developed a master and servant relationship. Because of their color, the poor non-slaveholding whites belonged to the master class, but they were not fully accepted as belonging to this class by either the slave-holder or the slave. An inferiority complex developed among the poor whites which has remained under changed conditions and which still makes the problem of racial adjust-

ment exceedingly difficult. Among many of the poorer elements in the South there persists the belief, found so often throughout history, that fear based upon the threat of violence "is the best means for maintaining any existing status of superior privilege. It is in this general region of old remnant traditions, selfish wishes and fears, and violent tendencies that our problem finds its most difficult features." Two other factors which have to be taken into consideration are the historical laissez faire attitude of the South toward school support and the lack of resources with which to support an adequate educational system. Kilpatrick concludes, then, that in determining whether an appeal should be had to the courts in any particular instance, the following factors should be taken into consideration.

1. The courts, whether they are aware of it or not, are sensitive to prevailing public opinion. They cannot do otherwise than to seek ways of carrying into effect what they deem sound public policy. Moreover, courts are very hesitant to interfere with the exercise of discretionary powers on the part of policy-forming and executive officers.

2. The popular support which a court decision will receive in the area of the court's jurisdiction must be taken into account. Hostile legislatures will find ways of thwarting unpopular court decisions. In fact the decisions may result in loss rather than gain.

3. Court decisions not supported by public opinion may lead to "reactionary opposition inflamed by demagogic politicians."

4. Even though favorable decisions might be won in the United States Supreme Court, such decisions "would not settle anything except the particular draft of the law or practice brought before it."

5. The poverty of the South is likewise to be taken into consideration.

Kilpatrick concludes his statement by pointing with some alarm to the activities of "a certain political-economic group, acting on a European psychologic analysis of society, [which] hopes to find in the Negro the needed fertile soil for a program of so creating trouble as to bring about a violent revolutionary change in the social order." He sees in this new agitation a dangerous threat to the peaceful solution of inter-race relations. The leaders of both races should act "to the end that wisdom and justice may prevail, not discord and violence."

Court Action the Only Reasonable Alternative

Thompson, in Chapter X, attempts to evaluate the arguments and the evidence bearing on the issue as to whether court action is desirable as a remedy to reduce or to remove the abuses of the Negro separate school. Policy in this matter is necessarily conditioned by the fact that during the past thirty years there has been an increasing disparity in the educational opportunities afforded white and colored children in those areas where separate schools are required by law. Not only that, there is a notable tendency to maintain separate schools even in those areas where separate schools are prohibited by law.

Starting with the firm conviction that the ultimate solution of the sep-

RESORT TO COURT: CRITICAL SUMMARY

453

arate school is its abolition, Thompson considers the alternatives to court action in those states where the separate school is legally established. Migration, revolt, and attempt to regain the ballot are deemed practically inconceivable. An appeal to the sense of fairness of the whites has neither eliminated nor minimized discrimination in school facilities. Court action is the only alternative.

Thompson finds little merit in the arguments against court action. To the contention that court decisions unsupported by public opinion cannot be enforced, he replies that by its very nature public opinion is based upon a rational consideration of both sides of an issue. Court action, therefore, is one of the processes of creating public opinion. It serves, moreover, as a barometer of "the social weather." That court action may invoke reprisals or disrupt race relations is not borne out by the facts. "Diligent search has revealed neither scientifically-collected facts, nor reliable empirical data, nor even valid logical deductions which indicate that this contention is based upon anything more valid than an *unreasonable* fear of an ignorant and apparently impotent minority in the face of a seemingly ruthless and powerful majority. Neither history nor logic confirms these dire predictions."

There is, too, little merit in the arguments for separate schools in those areas where such schools are prohibited by law. These arguments are: (1) Negro pupils are socially ostracized and discriminated against by white pupils and teachers. (2) In the matter of employment, Negro teachers are discriminated against in

the mixed schools (3) Negro pupils do better scholastic work and develop more wholesome personalities in separate than in mixed schools. The first argument can have little weight unless the second and third are true, and such evidence as there is does not indicate that they are true. The author examines the experimental studies carried on at the University of Cincinnati to determine the relative efficiency of separate and mixed schools, and concludes that they do not prove conclusively that the scholastic achievement of Negro pupils is any better in separate than in mixed schools, or that Negro pupils in separate schools develop more wholesome personalities than in mixed schools.

The arguments against the separate school are: (1) Segregation necessarily results in stigmatization. (2) The separate school is uneconomical. (3) Segregation is undemocratic and results in the "mis-education of both races."

Court Action a Doubtful Remedy

Williams, in Chapter XI, expresses the opinion that any widespread and vigorous attempt to improve the educational status of the Negro through an appeal to the courts would be a mistaken policy. He states, moreover, that his opinion is shared by a large number of white educational leaders in the South and by Negro leaders who have been most successful in securing public funds for Negro education.

Numerous arguments are advanced against vigorous court action in the immediate future. Favorable outcomes of court action would be more than offset by disastrous results of one kind or another. Among the unfavor-

able results may be listed: (1) retaliation, especially among white officials; (2) alienation of the support which Negroes are now receiving from white people and the consequent "set back" of healthy movements already under way for the improvement of Negro education.

Williams' distrust of vigorous court action grows out of his faith in the effectiveness of enlightened public sentiment as a means of securing better educational opportunities for Negroes. Such a sentiment is perceptibly developing in the South. It has, in fact, already resulted in a "general movement for better educational facilities for Negroes all over the South." The increase of Negro high schools in the South in recent years has been "rather phenomenal." If this movement to improve the educational opportunities of Negroes "is allowed to develop gradually and naturally, as it apparently bids fair to do, more good will come to Negro schools . . . than from any general attempts by Negroes to hasten progress by legal action."

GENERAL CRITICAL STATEMENT

Thompson points out that public opinion is developed by the clash of opposing views. If that be the case, the present Yearbook should contribute much to the creation of public opinion with respect to the separate school for Negroes. On many points there is sharp conflict of opinion among the various contributors and no doubt those who read the volume will find much with which they disagree. It is this focusing of various opinions on the issues involved that makes the volume particularly challenging.

In attempting to orient the separate school in the American social order, the contributors to the first part of the Yearbook have made a searching analysis of those forces which have determined the status of the Negro. They very properly regard the separate school as something more than an educational institution; they are correct in insisting that it is an instrument of policy and a symbol of status. They are correct, too, in their contention that the position of the Negro in the economic structure has been the most important factor in determining the total pattern of his social relations. Frazier and Bunche go so far as to insist that the economic and social emancipation of the Negro depends primarily upon the recognition of the community of interest between white and colored workers. They have little faith in interracial conciliation, or in the good will of sentimental whites. Bunche is also of the opinion that little can be accomplished through political action or appeal to the courts. On a number of these points there is ground for difference of opinion.

The influence of race antagonism in fixing the status of the Negro seems to be underestimated by Frazier and overestimated by Du Bois. No doubt many will be disposed to challenge Du Bois' statement that race prejudice is increasing.

The part of the Yearbook which attempts to reduce to systematic organization the principles of the case or common law relating to the educational rights of Negroes has been worked out admirably. There are, however, two interpretations of court decisions about which the writer is disposed to raise some question. Peter-

RESORT TO COURT: CRITICAL SUMMARY

455

son, and Hubbard and Alexander all agree that where there is no constitutional or statutory provision which requires or authorizes segregation, local authorities may not maintain separate schools. Certainly this position is supported by the weight of judicial opinion, but there is some possibility that the law on this point is not conclusively settled. In a number of the cases in which it was held that local school boards did not have authority to maintain separate schools, the wording of the statutes, or the history of legislation, was such that it seemed a fair assumption that the legislature did not intend that separate schools should be maintained.

There is, moreover, some authority to the effect that school boards may provide for separate schools for colored and white children even though the statutes are silent on the subject. In a case decided by the Supreme Judicial Court of Massachusetts, in 1848, it was held that the school committee of Boston had the implied power to provide separate schools for colored children. This case, it would seem, is still authoritative notwithstanding the later adoption of the Fourteenth Amendment. The court conceded that colored persons in Massachusetts were entitled by law to equal political, civil, and social rights. The court held, nevertheless, that the school committee, under its general power of superintendence, had the power to classify and distribute pupils in such manner as seemed best adapted to promote the interests of the schools.

The writer is also disposed to express some doubt as to whether the Supreme Court of the United States would extend the prohibitions of the Fourteenth Amendment as broadly as Hubbard and Alexander are inclined to think it would if the proper kind of action were brought. The cases they rely on as precedents in no way involved educational rights or the status of the Negro. After all, one cannot forget that the Supreme Court of the United States has found it possible to interpret the Fourteenth Amendment in substantial conformity with its own economic and social point of view. The logic of the law does not always lead to certain conclusions. Whether Hubbard and Alexander have discovered a remedy by which the Supreme Court can be brought to force the Southern states to provide substantially equal educational opportunities for the two races can only be determined by an appeal to the court.

In the third part of the Yearbook there is a clear and forceful presentation of the arguments for and against vigorous court action as a means of securing more adequate educational facilities for Negroes. From the necessities of the case, the reader will have to judge for himself the merits of these arguments.

The Yearbook is a distinct contribution to the literature of inter-race relations. It is a vigorous, challenging, and realistic presentation of an issue of vital interest to the members of both races.

CHAPTER XXII

AVAILABILITY OF EDUCATION FOR NEGROES IN THE
SECONDARY SCHOOL

WALTER G. DANIEL

INTRODUCTION

Education is the inalienable right of every American citizen. This principle is accepted throughout the nation, is repeated in the official documents of the several states and discussed at some length by professional educators. Following World War I and the revival of interest in democratic ideals there was an increased demand for educational opportunity. Larger enrollments were noted in schools all over the country. Negro secondary schools recorded an almost phenomenal growth for a twenty-five year period. In 1919-20 the enrollment in regular four-year high schools for Negroes in the seventeen states and the District of Columbia where separate school systems are maintained was 33,341.¹ This figure increased to 112,586 in 1929-30, to 254,580 in 1939-40 and dropped slightly to 247,374 in 1943-44. Paralleling this growth in numbers was the increase in the ratio of the high school enrollment to the total school population. High school pupils were 1.6 per cent of the Negro school enrollment in 1919-20, became 4.9 per cent ten years later, 10.5 per cent in twenty years and reached 10.9 in the twenty-fifth year. Such achievement has been accompanied by the enlargement of the

teaching staff from 935 in 1919-20 to 10,507 in 1943-44. These are truly great gains and they give cause for encouragement; but the continued lack of secondary education facilities for Negroes in many counties or other educational divisions in the South, the insufficient or ill-suited provisions quite generally characteristic of schools for Negroes and the slowness of progress toward the ideal of equality in educational opportunity give cause for thoughtful concern and critical scrutiny of the present situation.

SOURCES AND SCOPE

Previous chapters have treated the extent to which education is available to Negroes in the various states.

This chapter is concerned with the general availability of secondary education to Negroes on the basis of data assembled by the Bureau of Educational Research at Howard University for this special issue of the JOURNAL, of statistics from the U. S. Office of Education and of current trends as found in pertinent educational literature. The data for 1944-45 and comparative data for 1929-30 were taken from the files of the Bureau of Educational Research. The other figures on education are from Statistics of State School Systems, 1943-44.²

We propose in this article to indicate the nature and possibilities of a program that will provide equal facili-

AVAILABILITY IN THE SECONDARY SCHOOL

451

ties for Negroes on the secondary level. We shall consider the potential enrollment, the actual enrollment, the length of school term, transportation, current expenditures, the ratio of teachers to students, teachers' preparation and salaries, accredited schools, and the program.

ENROLLMENT

Since there was no national system of education in the country, the several states developed systems of schools which show many elements of variation along with much uniformity. Many Southern states developed a public school system of eleven years which comprised seven years of elementary school and four years of high school. Today practically all states have a twelve-year system, but the years regarded as a part of the high school show a considerable variation. Since the figures reported in the biennial surveys of the U. S. Office of Education are for the four-year organization and the information in the reports to the Bureau of Educational Research shows that this same type predominates in the states having dual systems, our treatment will be confined to this traditional pattern.

A publication of the National Association of Secondary School Principals³ proposes that every youth should remain in school until he reaches his eighteenth birthday or has completed high school. If a child enters school at the age of six and progresses normally he will attain this goal at the specified time. If all pupils progressed

at this rate, the age range of pupils in the four secondary years would be fourteen through seventeen. On this assumption we could obtain the potential high school enrollment by ascertaining the number of pupils in this range. This estimate was made for the seventeen states and the District of Columbia which have the dual public school system. According to the 1940 census tables there were 2,815,014 white youth and 876,806 non-white youth in these areas, or a total of 3,691,810 adolescents for whom an adequate program of secondary education must be planned. The figures for the age range show that 2,035,798 whites or 72.3 per cent and 544,690 non-whites or 62.3 per cent are enrolled in some school. They are not enrolled in high school, however, for the high school enrollment estimates are considerably smaller. According to the U. S. Office of Education there were 1,500,102 white and 247,401 Negro pupils in the traditional four years in 1943-44. If the potential enrollment figures previously mentioned are used, we would conclude that the high schools for white pupils are enrolling only 53.2 per cent of the expected number and the segregated schools only 26.8 per cent. Of course, some of the persons in the age-range of fourteen through seventeen have finished secondary school, or have gone to colleges, or may be attending private or specialized schools. Many, however, are greatly retarded and are still enrolled in the elementary school. When we realize that the Negro high school enrollment was only 10.9 per cent of the total Negro student population and yet 62.3 per cent of the fourteen

³National Association of Secondary-School Principals, *Planning for American Youth*. Washington: National Association of Secondary School Principals, 1944, pp. 64.

to seventeen age youth are in school, we become aware of the number of overage pupils in the elementary school.

One of the reasons for the small per cent of pupils in the secondary school is found in the alarming rate of drop-outs in the elementary school. In the Negro schools of the dual systems under discussion, there were 791,079 enrolled in the first primary grade in 1932-33. This figure included those who entered and those repeating. In 1938-39 when these pupils should have been in the seventh grade, there were only 151,997 pupils in that grade. In the following year the pupils enrolled in the eleven-year school systems would be in a four-year school and the eighth grade figure would naturally show a sharp decline. If the four-year high school figures are used, the fact that the per cent of pupils remaining in school is alarmingly low is clearly revealed. Roughly, one out of eight pupils of the beginning group reached the first year of high school. The enrollment of 101,017 for this year dwindled to 74,272 in the second year, to 51,097 in the third year and to 31,989 in the fourth year. The graduates numbered 31,180. Only 3.9 per cent of the first primary grade group finished high school. Only 30.9 per cent of those who reached the first high school year graduated. The situation for Negroes is in marked contrast to the nation as a whole. Of the 3,826,112 whites who were in the first primary grade in 1932-33, 953,254 or 24.9 per cent were graduated from high school and of 2,034,316 who were in the first high school year, 46.9 per cent graduated.

LENGTH OF SCHOOL TERM

The number of days that school is open indicates the extent to which a pupil may be able to receive the benefit of an education. In 1929-30 high schools were open for an average of 173 days for white students and 159 days for Negroes. In 1944-45, both systems provided schools for an average of 175 days. Of all the factors associated with providing equality of opportunity, this is the only one that has been realized. In this respect the Negro high schools are superior to Negro elementary schools for the latter have not achieved parity with white elementary schools.

TRANSPORTATION

Because of the rural character of the South, many high schools serve large areas and pupils must travel long distances to attend school. In recent years there has been a concerted movement for the consolidation of schools in such a manner as to make possible enriched offerings and better educational facilities. Associated with consolidation is the provision of transportation, for consolidated schools serve a larger geographical territory than smaller ones. Southern states have begun to appropriate larger sums each year for the transportation of pupils. For example, eight Southern states in 1929-30 spent \$9,598,837 for whites and \$63,536 for Negroes; in 1944-45 they spent \$27,219,324 for whites and \$1,370,713 for Negroes. The extent of equality may be seen by a study of the figures from five states which gave comparable data on the number of pupils transported and the amounts expended in 1929-30 and 1944-45 for

AVAILABILITY IN THE SECONDARY SCHOOL

453

whites and Negroes. Although these figures are not reported separately for the secondary and elementary levels, they show the extent of disparity in the accessibility of schools, so that the observer may deduce the effect upon secondary education. Because there are fewer high schools than elementary schools, the need for transporting high school pupils is greater. In 1929-30 five states reported expenditures of \$6,288,430 for transporting 439,723 white children and four of them expended \$48,473 for transporting 4,970 Negro children. The per capita cost for transportation was \$14.31 for whites and only \$9.73 for Negroes. Fifteen years later there were appreciable increases in the total amounts spent and a small amount in the per capita cost. The disturbing fact is the slow rate at which expenditures for the transportation of Negroes are approaching equality with those for whites. The 1944-45 figures showed a total of \$20,182,033 for 946,544 white pupils representing a per capita cost of \$21.32 and an expenditure of \$1,041,859 for 99,788 Negro pupils representing a per capita cost of \$10.44. The per capita cost of transporting Negroes is a gain of only \$.71 and the amount is \$3.87 less than the per capita cost for transporting whites in 1929-30. If the average per white pupil remained the same, it would require 229.5 years for Negroes to achieve equality in transportation, at a gain of 71 cents in fifteen years. The five states show very interesting variations. Texas, for example, made practically no gain in per capita expenditure for Negroes (from \$2.78 to \$2.89 or 11 cents) but approximately quadrupled the expen-

diture for whites (from \$7.23 to \$30.46). On the other hand, the state of Maryland seemed to have placed special emphasis on the Negro in a manner that would equalize the per capita costs. This state spent \$26.62 for each white pupil in 1929-30 and \$22.14 in 1944-45. It spent per Negro child transported the former year \$17.92 and raised it to \$23.59 in fifteen years.

CURRENT EXPENDITURES

The current expenditures for education in seven dual system states show the same general trends observed regarding transportation. In 1929-30 the annual expenditure for each white child in school was \$43.50 and for each Negro child \$11.26. The corresponding figures for 1944-45 were \$73.67 and \$32.46. The first significant fact is that the expenditure per Negro child had not reached in 1945 what it was per white child in 1930. If the per capita expenditure for the white enrollee remained constant and the per capita expenditure for the Negro increased at the rate of \$21.20 for a fifteen-year period about 29 years would be required to achieve equality of opportunity implied by this index. When figures for the seven states are examined, it is noted that North Carolina is the exception to the general trend observed. For the year ending in 1945 the state spent an average per Negro child of \$49.83 compared with an average per white child of \$40.32 for the 1930 year. Each state will have to follow this pattern if the rate of growth is to be accelerated and Negroes are to receive equal opportunity in a reasonable time. Otherwise the amount of money appro-

priated for the education of white children will increase by such large amounts that the total effect will be to continue a large disparity in the expenditures for the dual systems and delay progress toward equality.

VALUE OF SCHOOL PROPERTY

On the simple basis of dollars spent, the most serious discrepancy in the educational provisions for Negroes as compared with whites is found in the figures regarding the value of property used for school purposes, per pupil enrolled. In 1929-30 the average for the Negro pupil was \$32.47 and for the white \$165.56; in 1944-45 the amounts were \$52.40 and \$224.08 for Negroes and whites respectively. In order that Negroes may have the advantage of equal facilities as indicated by capital outlay, it would be necessary to increase the per capita expenditure by \$171.68. On the basis of a gain of \$20.07 for a fifteen-year period used in this study, about 129 years would be required to achieve equality.

THE TEACHER

Essential to the effectiveness of a school program is a teaching staff that is large enough to organize and direct the pupil learning, sufficiently educated to bear the responsibilities and perform services usually expected in the profession and compensated so adequately that a desirable living standard may be maintained. The exact class size for the most effective instruction is not known. Where small high schools are maintained there may be small classes while urban schools frequently have large classes. Many factors influence the educational proc-

ess and class size may depend upon the objective, methods and policies of the school. In spite of this admitted limitation of knowledge, essential guidance and desirable individualization in the educational process cannot be attempted without some appropriate ratio of teachers to pupils. In 1943-44 there were 90,898 white teachers and 10,507 Negro teachers in the separate high schools. These totals give a ratio of one teacher for 16.5 white enrollees and one for 23.5 Negroes.

The educational preparation of teachers is usually expressed in terms of the number of collegiate years completed. The possession of a bachelor's degree is generally required for obtaining a position as a high school teacher. In the District of Columbia most senior high school teachers have the master's degree when they are appointed and there is no difference in the preparation requirements for Negroes and whites. Comparable data were not furnished on this item. There were reports on Negro high school teachers from individual states. Tennessee gives an average education of high school teachers as 4.79 years. In Missouri the average range of college credits is from 120 to 149 semester hours which is above the bachelor's level. For Oklahoma, South Carolina, Texas and West Virginia, the average education of the Negro high school teacher is estimated to be the possession of a bachelor's degree. In Maryland 94.3 per cent of the Negroes possess the bachelor's degree while in Mississippi ten per cent have earned that degree. In Alabama the average education is reported as two collegiate years. The median training, there-

AVAILABILITY IN THE SECONDARY SCHOOL

455

fore, is at or near the possession of the bachelor's degree.

Improvement in salaries has been the most important need for teacher welfare since the war focused attention on the plight of the teacher. A new salary bill has just been passed for District of Columbia teachers and its provisions will apply to all school employees without reference to race. For six states which furnished figures for Negro high school teachers, the averages in 1929-30 were \$1,285 for whites and \$875 for Negroes, a difference of \$410. For these same states the averages in 1944-45 were \$1,640 and \$1,295 or a difference of \$349. In view of the fact that the Negroes' salary average was increased by \$420 in the fifteen-year period, this differential could be removed in twelve and one-half years, if the average for whites remained constant. Of the various differentials involving money, progress in regard to salary improvement is most encouraging. Since a number of suits involving salary equalization have been instituted in recent years, and some localities, including a few states, have announced plans for equalization, future progress should be made at an even faster rate than past growth.

ACCREDITATION

One measure of the quality of education is the evaluation of the work of an institution on the basis of factors that may be appraised by professional educators. By 1929-30 Negro schools in the Southern states had not been rated by the regional accrediting agencies. The Southern Association of Colleges and Secondary Schools took a highly significant for-

ward step when it began to rate Negro institutions. The first high school was approved in 1931. At the end of a fifteen-year period 163 Negro high schools had been accredited in fifteen dual system states included in the area of the Southern and North Central Associations of Colleges and Secondary Schools.⁴ These same associations had accredited 1,833 high schools for white students in the same area. Negroes have the possibility of attending 8.2 per cent of the approved high schools which include both public and private institutions.

THE HIGH SCHOOL PROGRAM

There is still a lack of clarity as to the purpose and program of the high school and the form or forms of organization best suited to its constituents. Agreement has been reached on some areas, namely, (1) that it should extend the common, integrating program which all pupils have begun in the elementary school, (2) that it should provide the necessary preparation for those who will probably go to college, and (3) that it should provide either the general education preliminary to vocational education or the specific occupational training necessary to prepare for earning a livelihood. The program of the high school is not meeting the needs of thousands of youth, black and white. The studies⁵ reported by Dr. Ambrose Caliver of the U. S. Office of Education show that offerings of Negro high schools are meager, that there is little relation between the curriculum pur-

⁴Information obtained from the lists published in *The Southern Association Quarterly* 11:14-56, 111-4, F 1947, and *The North Central Association Quarterly* 21:89-152, J1 1946.

sued and the occupation of the graduate or non-graduate, that the curricular and extra-curricular program for whites is generally superior to the offerings for Negroes. It is interesting to note that the ineffectiveness of secondary education throughout the entire South has been the cause of some concern. Dr. Fred Alexander⁶ of the Virginia State Department of Education, addressing the Southern Association of Colleges and Secondary Schools after consultation with educational leaders and writings, stated that the South provides programs geared to the needs of only fifteen per cent of the boys and girls enrolled and served only from forty to fifty per cent of those who should be in school. He advocated a revision of the curriculum, the planning of curricula for those who are going to college and those who are not, the development of comprehensive high school programs, and the consolidation of high schools. He suggested that adequate provisions for secondary education could be made in a school enrolling from 600 to 1,200 pupils. Education for Negro and white pupils needs revision and improvement. Unfortunately improvements for the minority group lag from 10 to 25 years behind those for the majority.

⁵Three pertinent studies by Caliver are *Secondary Education for Negroes*, U. S. Office of Education Bulletin 1932, No. 17. National Survey of Secondary Education, Monograph No. 7. Washington: U. S. Government Printing Office, 1933, pp. 121; *Vocational Education and Guidance for Negroes*. U. S. Office of Education Bulletin 1937, No. 38. Washington: U. S. Government Printing Office, 1938, pp. 137; *Negro High-School Graduates and Non-graduates*. U. S. Office of Education Pamphlet, No. 87. Washington: Government Printing Office, 1940, pp. 19.

⁶Fred M. Alexander, "Problems Facing Secondary Education in the South." *The Southern Association Quarterly* 11:271-9.

Mention was made of the need for vocational education for those persons who do not go to college and should acquire competence for earning a livelihood. The U. S. Office of Education study of Negro high school graduates and undergraduates⁷ found that graduates have a better occupational opportunity and less maladjustment than nongraduates. Of the more than twenty thousand people studied 64.8 per cent had no vocational training and 11 per cent said that their vocational training did not aid them in securing work. These findings suggest that the school seriously review its program. There are specific vocations which may be taught on the high school level. Some leaders in industry have suggested that the school can make its best contribution to developing individual competence by giving a background in science, mathematics, social studies and occupational information that will lead to an understanding of the principles and problems involved in various vocations; but that the school lacks the facilities and arrangements for teaching the specific techniques involved in many occupations which can be learned most efficiently on the jobs. In view of the fact that the number of pupils who drop out of school is greater in the case of Negroes and that the number who enter professions is small, it is necessary to stress vocational education and guidance as an important part of Negro secondary education. The best meth-

AVAILABILITY IN THE SECONDARY SCHOOL

457

ods and offerings are yet to be determined.

The junior high school and the junior college movements have not been discussed in this article. Such units, nevertheless, have been established in many localities. It is to be hoped that Negroes will share in any extension of facilities in accordance with their need and the principle of equality.

SUMMARY

Based upon the premise that all youth of secondary school age should receive equal opportunity in education, this article has sought to find out the extent to which secondary education is available to Negroes. It was found that:

1. There were 247,401 Negro pupils enrolled in the four traditional high school grades in 1943-44.
2. This number is only about 26.8 per cent of the number expected in terms of the potential enrollment of non-whites in the age range of 14 through 17.
3. The Negro high school enrollment was 10.9 per cent of the total Negro school population, whereas the white high school enrollment was 23.7 of the total.
4. Approximately 3.9 per cent of the first primary grade group finished the Negro high school and 30.9 per cent of those who entered the first secondary year graduated whereas 24.9 per cent of whites in the first primary year and 46.9 per cent of those in the first secondary year graduated.
5. In 1944-45 both white and Negro high schools were open 175 days.
6. Transportation expenditures per pupil transported averaged \$21.32 for whites and \$10.44 for Negroes in 1944-45; the amount for Negroes was a gain of 71 cents over 1929-30 and Negroes had not reached the average of \$14.31 for whites for this earlier year.
7. Per capita current expenditures for Negroes and whites still show great disparity. The figures for 1944-45 were \$73.67 for whites and \$32.46 for Negroes. Although these figures represent an increase of \$43.50 and \$11.26 respectively over the previous fifteen years, the Negroes have not yet reached the 1929-30 average for whites.
8. The amount of disparity between the two groups is greatest with regards to the value of school property per pupil-enrolled. In 1929-30 the average per Negro pupil was \$32.47 and for the white \$165.56; in 1944-45 the figures were \$52.40 for Negroes and \$224.08 for whites.
9. Negro teachers are rapidly approaching the minimum preparation for a bachelor's degree.
10. There has been some improvement in the salaries of high school teachers. In six states in 1944-45 the averages were \$1,640 for whites and \$1,295 for Negroes. These figures represented an increase over the 1929-30 averages of \$1,285 for whites and \$875 for Negroes.
11. In fifteen Southern states 163 Negro high schools have been approved and provide only 8.2 per

cent of the accredited facilities; the other 1,833 institutions are for whites.

12. Although the programs of both Negro and white high schools are poorly adapted to the needs of the majority of the adolescents, the offerings for Negroes are more meager than those for whites.

In an effort to determine the rate of growth and estimate the possibility of achieving equality of educational opportunity, the difference between Negroes and whites for each educational index for 1944-45 was calculated and then compared with the amount of gain made by Negroes for a fifteen-year period. As a result we were able to approximate the number of years Negroes would need to reach the average of whites for 1944-45. By this procedure it was found that equality might be achieved:

1. In 229.5 years in per capita transportation costs.
2. In 29 years in per capita expenditures.

3. In 129 years in value of school property per pupil enrolled.

4. In 12.5 years for high school teachers' salaries.

Computations for the initial three factors enumerated were made on the basis of figures combining the elementary and secondary school levels. It would have been desirable to have separate statistics but the conclusion regarding availability would be the same. Equality of high school term length has been achieved, equality of salary is attainable within the next ten years and is related to the approaching equality of educational preparation.

We conclude that secondary education is not available to Negroes to the extent that it is available to whites and that the remedy lies in making larger appropriations to Negro schools in sufficient amount to equalize the difference in per capita costs between Negroes and whites. Only then will the principle of equality in opportunity begin to operate and the educational responsibility of men to provide for the welfare of *all* people be properly borne.

VII

The Courts and Racial Integration in Education—A Critical Summary.

PUBLIC SESSION, FRIDAY EVENING, APRIL 18, 1952

The public Friday Evening Session of the Conference convened at 8:30 p.m. in Rankin Memorial Chapel of Howard University, Washington, D. C., with Charles H. Thompson, Editor of the *JOURNAL OF NEGRO EDUCATION*, presiding.

MR. THOMPSON: Ladies and gentlemen, I take great pleasure in welcoming you to the final session of the conference on the Courts and Racial Integration in Education.

You know, it is awfully encouraging to see so many of you present. One of my main apprehensions was that the Conference would be so concentrated that everybody would be fagged out by this evening, and so it is indeed very heartening to see that my apprehension was groundless.

This final session is devoted to the subject: "The Courts and Racial

Integration in Education—A Critical Summary." We have asked two persons specifically to summarize what has gone on in the other sessions. As you can imagine, that is a very difficult job, to summarize what has gone on during the past two days. The third person is going to give a general overall summary. Then we shall try to leave some time after those talks, to see whether or not you agree with those people who have critically summarized the conference. We would like to know very much whether you agree with the summaries and the criticisms.

(Thereupon, Mr. Thompson introduced Dr. Martin D. Jenkins, President, Morgan State College, who presented a prepared paper entitled, "Problems Incident to Racial Integration in Education and Some Suggested Approaches to these Problems.")

PROBLEMS INCIDENT TO RACIAL INTEGRATION AND SOME
SUGGESTED APPROACHES TO THESE PROBLEMS—
A CRITICAL SUMMARY

MARTIN D. JENKINS

President, Morgan State College

Our responsibility at this final session is to summarize in critical fashion the assumptions, findings, and conclusions of a three-day conference. This is not an easy task. All of the participants in this conference are distinguished persons whose views demand respect and consideration. Simply to summarize these views would not be too difficult. To be critical, however, in a personal

sense, would be presumptuous. I must, perforce, assume the role of a Quaker moderator and attempt to express "the sense of the meeting" in a not too uncritical fashion. The larger value of this conference lies in the critical summary and evaluation each delegate will make for himself.

The present paper is concerned primarily with the educational and social

problems incident to racial integration in education. The appraisal of court action and the development of cooperative acceptance are to be covered by other papers and will consequently be given only peripheral attention here.

It is desirable at the outset that the scope and limitations of this conference be explicitly defined. The conference is concerned primarily with racial integration in *education* and only incidentally with integration in other areas of American life. This is due in part to the fact that the proceedings are to be published in the Yearbook issue of a publication devoted to educational problems. It is due in larger part, though, to recognition of the facts that the public school is the symbol of democracy and equal opportunity and that the segregated school is more than simply an educational institution—it is an instrument of policy and a symbol of subordinate status. Education, consequently, becomes the center of attraction in the struggle against segregation.

The discussions have been confined largely to Negro-white relationships in this country. The integration problems of the Mexicans, the orientals, and the foreign-born have been only incidentally considered. Despite this neglect, these too are problems which America must face and solve.

Implicit in the thinking of the membership of this conference are several basic assumptions, the most important of which are the following:

Racial segregation and discrimination are incompatible with the ideals of a democratic society and a violation of the Christian ethic. Disabilities and distinctions based on race, therefore, have no place in American life; their

entire removal is a desirable and necessary goal.

This would appear to be a self-evident proposition in our society in accordance both with constitutional guarantees of individual liberty and the concept of brotherhood inherent in the Christian faith. This assumption probably is held, implicitly at least, by a majority of the American people. Except for a small minority of racists, even those who oppose racial integration present their objections to the removal of racial disabilities in terms of time and timing.

Attitudes in the area of race relations are rapidly changing to the extent that there is a readiness on the part of the dominant racial group to accept racial integration in education now to some extent and in some situations, and ultimately throughout the country and in all areas of American life.

The dynamic character of race relations is, of course, a matter of fact. In the area of education the admission of Negroes to Southern graduate and professional schools, the increasing integration of Negro students and teachers in schools and colleges of the North, the deterioration of racial segregation practices in the educational programs sponsored by the armed services have all been accomplished without friction and indeed with the general acceptance of the white groups concerned. Integration works anywhere it has been tried.

Racial integration, although in accordance with the principles of our social organization, is contrary to historic and current practice. Its functional incorporation into the social fabric, therefore, has created and will create opposition and tension.

APPROACHES TO INTEGRATION PROBLEMS

413

We are all creatures of our culture. Deep-rooted behavior patterns, such as those involved in racial relationships, are not easily and readily changed. The protection of vested interests, whether concerned with the material fact of economic competition or the psychic fact of maintenance of the ego, inevitably constitutes a barrier to change. It is recognized that in the implementation of racial integration there will be individual casualties, in an economic and social sense, among both Negroes and white persons.

Finally, in its deliberations the conference implicitly accepted Thompson's definition of the term *racial integration*: "Full racial integration in education means that schools will be established and maintained where the admission of students; the employment of teachers, non-teaching personnel, administrative officers, and members of boards of control; and participation in the official life of the school by all concerned are based upon aptitude, ability, and character rather than race."

It was not clearly understood by all participants that the mere admission of Negro students to schools and colleges from which they formerly were excluded, or the token employment of a Negro teacher are, by definition, only steps toward integration as conceived by this conference, that *desegregation*—i.e., the mere admission of Negro students to existing institutions for white people—does not constitute *integration* proved a serious source of confusion to some.

It was held by others, correctly, I think, that true integration goes far beyond the mere physical fact of non-segregation; that it involves as well a feeling of acceptance and a sense of

belonging on the part of the participating individuals.

THE PRESENT STATUS OF RACIAL
INTEGRATION IN EDUCATION

Provisions for the education of Negroes have been greatly improved throughout the South, particularly during the last decade, largely, but not entirely, as a result of legal pressures exerted by and under the direction of the National Association for the Advancement of Colored People. The principle of "separate but equal" facilities has been generally adopted by the dominant racial group and in many, many localities a real effort is being made to bring Negro schools up to the level of their white counterparts. Nevertheless, by all objective criteria, facilities and opportunities for Negroes are still greatly inferior to those for whites.

Negro students are currently enrolled in graduate and professional schools, and in some instances undergraduate curricula in institutions formerly restricted to white students, in 12 Southern states and the District of Columbia. These steps towards desegregation have taken place without incident and with the general and sometimes enthusiastic acceptance of students and faculty. Except in a few parochial schools, racial segregation at the level of elementary and secondary education is universal practice throughout the South.

With a few important exceptions, full racial integration in education does not now exist in any state or any section of the country. Significant steps toward integration are being made in the Northern tier of states and in a number of communities, particularly in Connecticut, New Jersey, Minnesota, and the far Northwest where

teachers, as well as students, are being assigned to classes freely without regard to race, and Negroes are appearing with increasing frequency as members of governing boards of the public schools.

Despite these instances of real progress, however, only a very small minority of the Negro population of the North is experiencing full integration and the trend toward desegregation in the South is substantially limited to a few Negro students at the graduate and professional level.

Not a single conference participant expressed satisfaction with the *status quo* or with the progress that has been made in improving the educational opportunities of Negroes—as substantial as this progress has been. Despite this, there has been exhibited a considerable degree of optimism concerning prospects for future progress.

A complex of factors has operated to make possible now a basic change in social pattern which would have been almost inconceivable a quarter of a century ago. The Rooseveltian “New Deal” with its emphasis on the underprivileged; the impact of court decisions; the ideological conflict with communism; the rise of nationalism among the darker peoples of the world; the increasing educational level and political power of the Negro people; the industrialization of the South; the increased sensitivity of religious leaders to social problems; the scientific and practical demonstrations of the abilities of Negro individuals; the cumulative effect of many local incidents of violation of racial mores; and full employment with a resultant decrease of economic conflict have all combined to create a social atmosphere which makes positive

progress in race relations possible—indeed inevitable, so long as these factors continue to operate.

That last clause—so long as these factors continue to operate—is tremendously important. Perhaps the conference participants are too optimistic in their (almost) unanimous assumption that the curve of progress in racial integration will continue its upward course in geometric progression. One important aspect of the struggle for full citizenship rights lies in the maintenance of a social atmosphere conducive to further progress.

BASIC PRINCIPLES AND PROBLEMS

From the proceedings of this conference there have been developed areas of agreement on basic issues involved in the problem of racial integration in education.¹ These areas of agreement which may be regarded as *basic principles*, are as follows:

1. Present patterns of racial segregation and discrimination tend to deprive our society of the best resources of the Negro race and to weaken our nation in its ideological conflict with non-democratic powers.
2. The fight for the admission of students to schools and colleges, the employment of teachers and administrators and the selection of governing boards without respect to race must be carried on relentlessly and with increased vigor by all those who are devoted to the democratic way of life.
3. The struggle for racial integration must be conducted within the constitutional framework of our govern-

¹No votes were taken during the conference. Although there was no articulate disagreement, it is probable that some delegates do not fully subscribe to the principles stated.

APPROACHES TO INTEGRATION PROBLEMS

415

ment and with the utilization of tactics appropriate to a democratic society.

4. Racial integration in education is part of a larger complex involving integration in other areas such as employment, housing and government. It is necessary and desirable that the problem of racial integration be attacked on many fronts—legal, political, educational, governmental—rather than on a single front.

5. Participation in the areas of public interpersonal relations such as employment, schooling, housing, politics, civic activities and other public services, without discrimination on account of race, is a basic right which must be guaranteed every citizen by law.

6. It is not possible to establish “separate and equal” facilities. The best education of all students, from the elementary through the graduate level, can be achieved only under conditions of racial integration in our society.

7. Educational institutions organized on the basis of race must redefine their purposes and seek to serve a clientele on a non-racial basis where this is legally permissible.

8. Integration practices are not to be selective and applicable only to a few. The token admission of a few Negro students to schools and colleges formerly restricted to white persons and the token employment of a few Negro teachers in schools and colleges cannot be regarded as satisfactory even as a step toward integration.

There were a number of areas in which there was a considerable amount of disagreement and in which the conference could not arrive at a consensus. The more important of these areas of disagreement, which are termed

here *problems*, will now be briefly considered.

THE ROLE OF THE NEGRO COLLEGE UNDER INTEGRATION

The conference gave considerable attention to the question of what will happen to the Negro institutions of higher education, both public and private, under conditions of desegregation and integration. These colleges were established and are now supported to afford opportunities which were and are not available to Negroes at the institutions attended by white persons. There is no question but as racial bars are lowered the role of the segregated college will change. The extent and direction of this change cannot now be predicted nor can any general statement be made which will apply equally to the future of every existing institution.

It was the consensus of this conference that under conditions of full racial integration some of the present Negro colleges will be discontinued but that many will and should continue to exist, but as institutions serving all the people. It is felt that the first casualties will be the weaker colleges and those geographically adjacent to the stronger existing white institutions. In view of the anticipated increase in college enrollments in the years ahead, most of the publicly-supported institutions will be retained as a part of the states' system of higher education. A majority of the existing privately-supported colleges for Negroes will continue to exist to serve a clientele on an integrated basis and thus join the scores of private colleges now serving their respective communities in the South. The racial composition of the staffs of both

existing white and Negro institutions will undergo a process of gradual change and integration.

The land-grant colleges for Negroes pose a special problem because of their highly specialized curricula and because their programs are not comparable in scope and quality with white land-grant colleges in the same region. With Negro students freely admitted to the state universities and land-grant colleges, existing institutions for Negroes need no longer strive to become prototypes of the presently-organized white institutions. If these institutions are to survive at all in their land-grant function, their program must be reorganized to offer specialized curricula for the benefit of all of the people of the state. The danger here, of course, is that, under such arrangement an attempt may be made to perpetuate present patterns of inferiority and segregation and thus force continued appeal to the courts. There is need for serious and critical thinking with respect to the purposes and program of the existing land-grant colleges. The only alternative to the ultimate abandonment of the land-grant phase of their work is a redefinition of function in terms of service to all citizens of the state.

I sense the majority opinion of this conference to be that the Negro colleges have the responsibility of "working themselves out of a job", not necessarily as colleges but as segregated institutions. It is recognized that in the process there will be casualties among both administrators and teachers, and immediate losses to communities through being deprived of cultural centers. In the final analysis, though, Negroes will benefit through

improved educational facilities and increased opportunities for employment and adjustment in the general society. I may add that little attention was given, other than in the area of employment, to losses which will come with integration.

Adjustment of Negro Teachers and Administrators

The severity of the adjustment problem to be faced by Negro staff members depends in large measure upon the abruptness of change and whether, as anticipated, a large portion of existing institutions will be retained. Eventually, Negro teachers will take their places beside their white colleagues in schools and colleges throughout the nation. The short-term problem is one of individual competence and the willingness of institutions and communities to accept Negro teachers in non-segregated classrooms.

Just as in other areas of American life where racial segregation practices have been altered, institutions and communities throughout the nation will come to accept Negro teachers and administrators on the basis of their professional ability, as is being done now in a number of Northern cities and states. Negro teachers must be prepared to compete not as a unit but as individuals and with all others engaged in similar lines of work. As pointed out in this conference by Miller, "Only as the individual is willing to work harder, study longer, express himself more precisely, delve more deeply into research can he expect to achieve the goals he and his people have set for themselves. The Negro is, at this point, in the same position as representatives of other minorities. He cannot escape

APPROACHES TO INTEGRATION PROBLEMS

417

such rivalry nor can he hope to gain his place on other terms."

Adjustment of Negro Children and Youth to the Integrated Situation

Almost entirely neglected in this conference was the problem of the adjustment of the Negro child or youth who participates or shares directly in a racially-integrated situation in high school or college. Since this problem was not considered, I can only call attention to the fact that children and youth do, and will, in the beginning at least, have difficulties in academic and social adjustment. The effect of these problems both on the individual and on the process of integration demands careful consideration and study.

ELEMENTS OF A PROGRAM FOR THE FUTURE

The very topic of this conference has served to place emphasis upon the legal approach and to divert attention from other important techniques for achieving integration.

It is recognized that there is no alternative to court action in the elimination of segregation in the schools and colleges of the nation. It is clearly the sense of this conference, however, that racial integration in education cannot be achieved by court decisions alone. Other tactics, techniques, or approaches must be utilized concurrently to achieve racial integration. These things will seem "old hat" to members of this audience; as familiar as they are, though, they are essential.

Before considering each of the several approaches, I wish to make two observations which are relevant to the grand strategy of achieving racial integration.

First, it is a matter of considerable significance that there was little indication in this conference of any willingness to compromise at any point. Nevertheless, it is universal social and political experience that deep-rooted issues on which the protagonists hold tenacious views are resolved through compromise. At the risk of being termed an appeaser, I believe that we must be prepared to compromise, not on basic principle, but on intermediate adaptations at many points.

Second, it is imperative that in our struggle for democracy we preserve the democratic tradition of respect for minority viewpoints. There is observable a tendency to be impatient with persons whose views with regard to a particular tactic to be employed differ from the majority view. We must, of course, maintain and insist upon a solid front on the basic issue of the elimination of racial segregation from American life. Let us, though, recognize that there are choices in strategy and that persons of the highest integrity may often select different alternatives to arrive at common objectives.

Education

Certainly no thoughtful person would deny that racial integration in education can be achieved in a fundamental sense only if it is acceptable to—or at least not rejected by—a majority of the dominant racial group. It follows, then, that education—and we may include in the term "good" propaganda—is a desirable and necessary tactic.

The 13th Yearbook of the Journal, *Education for Racial Understanding* (1944) explored in much greater detail than was possible in the present conference the question of how the edu-

cational process might be effectively utilized. It was pointed out that the immediate function of education is to change the attitudes of the majority racial group through the utilization of schools and colleges, the church and religious organizations, organized labor, advancement organizations, government agencies, mass communication media and personal contacts.

An action program on the basis of the findings of the 13th Yearbook is necessary and desirable. To be guarded against, however, is the tendency to restrict education to verbalization and to allow talk to become a substitute for action. The effectiveness of education must be judged not simply by increased knowledge but in terms of changed behavior.

There is need, too, for redirecting the attitudes of Negroes themselves with respect to the problem of racial integration in education. The Negro people generally must be brought to understand the limitations placed upon them by segregation practices. In our segregated schools and colleges advantage must be taken of the opportunity to teach our youth democratic viewpoints and techniques for achieving racial integration.

Political Pressure

Negroes are becoming an increasingly significant factor on the American political scene. They are voting in the South to a greater extent than ever before and in many Northern states and communities they constitute the balance of political power. The emergence of this group has exerted tremendous influence on the alignment of diverse groups within the two major political

parties and in isolated instances has resulted in tangible and observable gains for the masses of the Negro people.

The use of the ballot for social reform in a democracy is a basic and legitimate procedure. Effective utilization of this instrumentality to attain racial integration in education entails the delineation of definite goals, political education in schools and on the adult level, intensified campaigns on the local level to increase the number of registrants and voters, and the education of candidates on the issues of race.

It must be clearly recognized, however, that for a minority group to structure an election on the basis of race alone would be fatal to the attainment of its objectives. What is indicated is the support of genuinely liberal candidates, regardless of party affiliation, who exhibit a readiness to incorporate Negroes into the fabric of American life.

Statutory Enactment

The 14th Amendment to the Federal Constitution, which guarantees the individual the full privileges and immunities of citizenship, due process and the equal protection of the laws, provides the constitutional basis for the legal attack on racial segregation. The Constitution, however, "means what the Supreme Court says it means" and in a more fundamental sense means what the people clearly demand that it mean. Interpretations in the area of civil rights, as in others, vary, therefore, with changes on the personnel of the Court and with changes in the climate of public sentiment.

The enactment of legislation should

APPROACHES TO INTEGRATION PROBLEMS

419

be sought at both the Federal and state levels which specifically prohibit racial segregation in education. A number of states have already enacted such legislation with varying degrees of effectiveness. The experience at New Jersey, whose constitution provides that "no person shall be denied the enjoyment of any civil or military right, nor be discriminated against in the exercise of any civil or military right, nor be segregated in the militia or the public schools, because of religious scruples, race, color, ancestry, or national origin," (Art. 1, Sec. 5) suggests that with the appropriate techniques and social climate, racial integration in education can be achieved.

Legislation which assures the tenure and seniority rights of teachers should also be sought. It is to be emphasized, however, that the experience of states such as Illinois shows that mere adoption of such legislation will not assure integration. Desirable if not essential concomitants are, determination of state officials to administer the law with firmness and the imposition of financial sanctions on school districts for non-compliance.

While it is unrealistic to anticipate the enactment of such legislation in the Southern and border states in the foreseeable future, this is a basic and effective approach to promote integration involving both students and employed personnel.

*Enlisting the Support of
Liberal Southerners*

In my experience, there are many, many Southerners, call them "cultural sports" if you will, who are ready not only to accept but to work for racial integration. They are to be found at

all class levels and at all ages but particularly among the younger generation. As Granger pointed out at an earlier session, "The intensity of the spirit of liberal reform in the South has probably been exaggerated by professional optimists as seriously as it has been underestimated by determined pessimists. Nevertheless, it is a fact that such a spirit does exist and is growing steadily. There has been too little recognition and examination of that growth by the very people who have most to profit from it."

*Utilization and Cooperation of
Advancement Associations*

Our advancement organizations, the National Association for the Advancement of Colored People, the National Urban League, the American Council on Human Rights, the religious and fraternal councils and committees have done a magnificent job in promoting the cause for human rights in this country. Without these organizations, especially, in this connection, the NAACP the upsurge in educational opportunities for Negro youth would certainly not yet have occurred.

The very holding of this conference has vital meaning for these organizations. The process of sitting down and discussing problems with officers of other organizations having similar goals, and legal, educational, and governmental leaders from all sections of the country cannot fail to yield fruitful values. This procedure will serve to keep the leadership of these advancement organizations in close touch with the field and to avert the minor, and sometimes major, conflicts of policy. I would urge these organizations to provide for the calling of periodic confer-

ences such as this one as a technique for testing the validity and feasibility of projected lines of action.

Utilization of Non-Racial Organizations

We have had the common experience in this conference of considering the racial question involved as if it exists in a vacuum; as if it is unrelated to all the other social, economic and political forces operating in our society. This is not altogether fair criticism, for among the participants have been representatives of labor, the church, and government. But it is a substantially valid comment in that the discussions have been couched almost exclusively within the frame-work of Negro-white relations.

Recognition must be given to the fact that the problem of racial adjustment touches many facets of American life. The indirect approach to racial integration, through identifying our interests with the basic objectives of labor, the church, political organizations, and the like, may in a fundamental sense be just as effective as direct attack. Let us, then, cooperate with and become a part of all those movements and organizations in American life which have as their objective improvement of the welfare of the people.

CONCLUSION

This has been a fruitful conference and it has made a significant contribution to race relations in this country. I believe it will come to be regarded as one of the important milestones in the exciting, if sometimes halting, journey this country is making toward a truly democratic society. There were

a number of areas of disagreement as to tactics, as to immediate outcomes to be sought. But the main lines, the important lines, are clear and unmistakable.

Perhaps the most important single outcome of this conference is the demonstration of the absolute unanimity of Negro leadership that racial segregation must be abolished from American life. There was not a single dissenting voice. So far as Negro leadership is concerned, the doctrine of "separate and equal" facilities is dead as an objective or as a satisfactory solution.

There is full agreement, further, that there is no alternative to legal action "to secure these rights" and that seeking favorable judicial decisions is a continuing urgent necessity.

There is a consensus that judicial decisions will not in and of themselves result in integration. An essential concomitant is the development of favorable racial attitudes among the dominant racial group. The implementation of a supplementary program along the lines suggested in this paper is an urgent responsibility of our leadership.

We say to America and to the world that racial segregation is incompatible with the ideals and goals of our nation; that it prevents our country from exploiting in full the resources inherent in the Negro people and thus weakens our domestic economy; that it provides for our opponents in the world-wide ideological struggle a potent weapon for enlisting the support of darker peoples throughout the world and thus weakens our international position. We believe that the attainment of our goals, therefore, will serve the vital interests of our nation. (Applause)

APPROACHES TO INTEGRATION PROBLEMS

421

MR. THOMPSON: Before we come to the second appraisal, I want to take just a moment to refer to one thing that Dr. Jenkins has said. I do not know whether I made this statement on the opening night, but you will remember that he said that this conference was composed of people that were left of center and that one of the things that he missed here was the flavor of the right of center.

Well, let me say for the benefit of this audience that I did all that I could to get more of the opponents of integration here. I invited the school superintendents of 20 states to this conference. Half of them wrote very nice letters of regret; and I guess the other half did not believe I meant it.

We did all we could, Dr. Jenkins, to have more of this group present. However, I am sure that you will agree that the conference has not discounted or overlooked their point of view.

Now, the next appraisal is to be given by Dr. Nabrit, and it is called, "An Appraisal of Court Action as a Means of Achieving Racial Integration in Education." He has warned me that he cannot do this in less than 40 minutes although I have given him thirty. We shall see.

(Thereupon, Mr. Thompson introduced Dr. James M. Nabrit, Jr., Professor of Law and Secretary, Howard University, who addressed the Conference as follows.)

AN APPRAISAL OF COURT ACTION AS A MEANS OF ACHIEVING RACIAL SEGREGATION IN EDUCATION

JAMES M. NABRIT, JR.

Professor of Law and Secretary, Howard University

Mr. Chairman, Ladies and Gentlemen:

Those of us who have been fortunate enough to be present throughout this Conference have witnessed a highly significant, and I believe, constructive event occur in the field of education; namely, a thorough-going examination of the "Courts and Racial Integration in Education," a penetrating analysis of the varying patterns of segregation in education, a thoughtful consideration of means of eliminating them, and a keen study of the relationship of segregation in other areas of life to the problems faced in education. What is most important is, that this National Conference brought together scholarly experts in law, education, psychology, economics, sociology and government,

and strategically placed persons in "action" activities in the public life to mutually inform each other, to cooperatively grasp the scope of the problem confronted, and to comprehensively plan basic approaches to its solution.

Although the exact position of the "Talmadge" group was not presented as such, the editor of a leading Southern newspaper was present, and clearly set forth the conservative viewpoint of the white South. Invitations were extended to administrators of public school systems in all the Southern states. In spite of the absence from the Conference of exponents of the viewpoint of the most reactionary elements of the white South, it is safe to say that their position was injected into the discussions and consideration

AN APPRAISAL OF COURT ACTION AS A MEANS OF ACHIEVING RACIAL SEGREGATION IN EDUCATION

JAMES M. NABRIT, JR.

Professor of Law and Secretary, Howard University

Mr. Chairman, Ladies and Gentlemen:

Those of us who have been fortunate enough to be present throughout this Conference have witnessed a highly significant, and I believe, constructive event occur in the field of education; namely, a thorough-going examination of the "Courts and Racial Integration in Education," a penetrating analysis of the varying patterns of segregation in education, a thoughtful consideration of means of eliminating them, and a keen study of the relationship of segregation in other areas of life to the problems faced in education. What is most important is, that this National Conference brought together scholarly experts in law, education, psychology, economics, sociology and government,

and strategically placed persons in "action" activities in the public life to mutually inform each other, to cooperatively grasp the scope of the problem confronted, and to comprehensively plan basic approaches to its solution.

Although the exact position of the "Talmadge" group was not presented as such, the editor of a leading Southern newspaper was present, and clearly set forth the conservative viewpoint of the white South. Invitations were extended to administrators of public school systems in all the Southern states. In spite of the absence from the Conference of exponents of the viewpoint of the most reactionary elements of the white South, it is safe to say that their position was injected into the discussions and consideration

given to it by several of the speakers present.

Now, I do not propose to give a critical summary of each of the papers presented here, as I hope that my general summary of the Conference will take them into account, properly.

In the *first* place, the Conference was unanimous in its conclusion that segregation be uprooted from our democratic way of life.

It may safely be said that much of the law in this country developed out of a background of conditions then prevalent in a pioneer, rural, agricultural economy, where nationalism and individualism were dominant ideas. Many of the doctrines, much of the philosophy, and a considerable number of the laws and judicial decisions formulated or adopted to fit those conditions are not adaptable to our present urbanized industrial economy, in the face of an increasing wide-spread emphasis on an economic and cultural unification.

In particular there is a growing recognition of the idea of guaranteeing by law universal reasonable expectations involved in life in a civilized society. This is shown in recent provisions in many parts of the world for strengthening and enforcing bills or declarations of rights and in increasing formulation of such expectations not only in newly set-up states and in new constitutions for old states, but notably in proposed world constitutions. Illustrations of this may be found in the Russian Constitution, the United Nations Charter, the Proposed Constitution of Puerto Rico and the new constitution of New Jersey, which specifically interdict state action based on race, color or religion.

A reasonable expectation today, then,

of every American is that he will not be accorded state or Federal treatment solely on the basis of race, color or religion. If there be increasing emphasis on an economic and cultural unification of the entire world with a universal bill of rights, it is certainly a reasonable expectation that America, one of those leading this movement, would rid itself of legalized racial separatism.

In the *second* place, the Conference was unanimous in its opinion that court action was one of the best ways to get rid of segregation imposed by statutes or judicial decisions. Resort to the Courts is a normal method of doing this. It is in fact one of the only two ways of doing this—by resort to courts or legislation. Both are good. For the South, the courts are best. The Conference came to the conclusion that most of the extension and retention of segregation has been the result of judicial action. Therefore, we should resort to the courts to change these decisions.

Law and government must change as society and philosophies change. Some illustrations that many of our former concepts must yield to these changing conditions may be found in the field of labor law, in laws governing leases of urban apartments, in the law of privacy, and in air law. Slavery and the system of racial segregation which succeeded it are products of that pioneer, rural, isolationist background, but today both appear out of harmony with our nation's claim to leadership of a world of many races clamoring for basic human rights. The separate-but-equal doctrine is also a product of that background.

To paraphrase Mr. Justice Cardozo's

AN APPRAISAL OF COURT ACTION

423

language in the *Allegheny College Case*, courts today tend to treat the separate-but-equal doctrine as if it were identical with the equal-protection-of-the-laws clause of the 14th Amendment of the Constitution of the United States. A classic form of statement frequently made is "separate but substantially equal." So compendious a formula is little more than a half-truth. There is need of many a supplementary gloss before the outline can be so filled in as to depict the classic doctrine, "Equal protection of laws." It is not enough that there be substantially equal protection of laws. It is not enough that attempts be made to achieve this on a racially separate basis.

The half-truths of one generation tend at times to perpetuate themselves in the law as the whole-truths of another, when constant repetition brings it about that qualifications, once taken for granted, are disregarded or forgotten. The doctrine of "separate but equal" has not escaped the common lot.

The doctrine of "separate but equal" is generally credited to the decision in *Plessy v. Ferguson*, in 1896. This case in turn cited *Roberts v. Boston* decided in 1849. A mere cursory acquaintance with the facts of American history tells us that *Roberts v. Boston* was decided when the institution of slavery was in existence, in a period of which a few years later the Supreme Court in the *Dred Scott Case* said, "a Negro had no rights which a white man was bound to respect." While the origin of this doctrine thus lies in the slave system, with its laws, customs, lack of citizenship of the Negro, these qualifications and limitations of the doctrine are forgotten in *Plessy* in 1896. When

Plessy was decided a civil war had been fought, slavery abolished and the 14th Amendment passed, giving state and Federal citizenship to the Negro, and *Railroad Company v. Brown* had been decided by the Supreme Court in 1873, all subsequent to *Roberts v. Boston*. In the *Brown Case* the Court decided that separate accommodations, no matter how identical they might otherwise be, were not equal. The Court in *Plessy* and subsequent cases has disregarded the *Brown Case* and the historical background out of which arose the *Roberts Case*. As a consequence, the Court has in effect placed a judicial limitation on the citizenship of the Negro; and has substituted for equal protection of laws a "separate but substantially equal" protection of the laws; by importing a philosophy of racial separatism properly applicable only to the slave system into the 14th Amendment, which was designed to end the last vestiges of that same slave system. This tendency toward effacement of the great clause of the 14th Amendment has not lessened with the years. From the field of transportation the separate-but-equal doctrine has been applied to all areas where the state exerts its power, where and when deemed expedient. The Court's use of the separate-but-equal doctrine reminds me of George Orwell's delightfully satirical novel in which the final commandment was painted in large letters on the barn in Animal Kingdom: "All animals are equal but some animals are more equal than others."

In the *third* place, the Conference agreed that court action alone would not achieve integration. Mere enactment of laws in the field of civil rights, courts to apply them, and a political

organization behind them, will not of themselves secure equal justice under law. Administrative injustice may be suffered which is not readily amenable to court action. Witness segregation in the army in spite of the executive orders to end it. We are too well aware of laws and judicial decisions which are not enforced in our country today. Witness segregation in education in Illinois and other Northern states where it is unlawful. Segregation may result from the mere fact of residence, not laws. We must prepare our cities and states and country for acceptance of the doctrine of the universality of human rights before they can be effectively enjoyed. This requires a new interpretation of our constitution. This requires the geographical, economic, and historical understanding of sociology and politics. It requires knowledge of the social, social-psychological and economic background in which legal precepts must operate in their interpretation and application. It requires a revitalization of the principles underlying our democracy. Justice is the ideal relation of man. We seek to attain it primarily through a regime of adjusting relations among men and ordering men's conduct by systematic application of the force of politically organized society. But other factors and forces temper justice in our society. We must take account of them too—educational, sociological, psychological, economic, religious, and political factors. Frustration arising from tensions of urbanized life may manifest itself in racial injustice and prejudice, to mention only one of these.

In the *fourth* place, the Conference agreed that racial integration in education was only a part of the larger

problem of segregation in general. The problem of segregation in education cannot be isolated from the problems of segregation in all other aspects of American life, particularly employment and housing. It is only one facet of the total problem. The fundamental inquiry then is, can we have racial integration in education as long as segregation per se is lawful? The answer is *no*.

Our appraisal of court action as a means of achieving racial integration in education shall be made, then, in the light of those basic findings of the Conference. It shall also be made in a further belief in these five legal propositions: (1) The present domestic and world conditions reflect a different background from that out of which the separate-but-equal theory arose. (2) The theory cannot be satisfactorily adapted to these changed conditions. (3) Government has no constitutional power to segregate citizens for the purpose of education on the basis of race, color or religion. (4) Some types of discrimination (administrative, e.g.) in education cannot be readily affected, if at all, by resort to the courts. (5) Laws and judicial decisions requiring segregation should be subjected to direct legal attack as being unconstitutional per se.

Some confusion may be avoided if an analysis is here made of some specific aspects of our problem by setting forth three questions which occupied a major portion of the time of the Conference and its answer to them.

1. Does the role of the courts in achieving integration in education depend upon the type of racial disabilities imposed? The answer is *yes*.

If they are laws or judicial decisions,

AN APPRAISAL OF COURT ACTION

425

use the courts but legislative action may also be effective.

If they are administratively imposed, in some cases courts may give some relief but use all community aid available.

If they are results of concentrated racial residential areas, courts are of little avail. Here the whole field is left to social workers, legislators and others.

II. Is the legal theory to be utilized in litigation before courts a matter to be decided by lawyers rather than by sociologists, psychologists, social workers, or educators? The answer is *yes*.

In this area the legal theory upon which the lawyers base their cases is that government, state or Federal, has no constitutional power to exert its force in dealing with its citizens on the basis of race or color. We think the attempt of the government to do this violates the Federal Constitution, in that it violates the equal protection of the laws, denies due process, violates prohibition against Bills of Attainder, and is in violation of the Civil Rights Acts. The supplemental and implemental action to be taken will have to be decided upon by the social workers, psychologists, educators, politicians, economists, and the church people.

III. Where the courts *are* a vital factor what are the consequences of their use? The answer is that they are significant, but not sufficient.

Successful court action alone will not *ipso facto* achieve racial integration in education. However, the invalidation of laws authorizing racial segregation in education will be a significant and important contribution toward the achievement of integration in education. The primary accomplishment is that it

will remove the barrier of illegality from the pathway of integration. A favorable court decision removes the respectability which law gives to segregation and any fears of fines or imprisonment for associating with members of the different races. It creates a climate within which more effective use of other methods of eliminating segregation may be utilized freely, such as education, legislation, executive orders, voluntary activity, and normal political, economic and social development. As Mr. Roscoe Pound says: "Law makes habits, it does not wait for them to grow." As long as statutes or court decisions threaten persons with fines or imprisonment if racial segregation is attempted in education, they deter local experimentation and normal social development.

Aside from this obvious and fundamental merit of a resort to the courts in this field, seven other consequences flowing from court action may be indicated. (1) A favorable judicial decision instantly is operative over wide areas in the field of civil rights; over state-wide areas in graduate and professional education and over city-wide and country-wide or school-district-wide areas in elementary and secondary education.

(2) It serves as an educational device and aids in the crystallization of antisegregation sentiment.

(3) It has a psychological effect upon the entire community. It reveals in clarity and nakedness the obvious discriminations long glossed over in the segregated school system in the South. It shocks many of the non-concerned whites into a realization of the basic injustice being inflicted upon the Negro community. It reveals inner

strength and unity both within the Negro community and between the Negro and white community. It stirs to action that at-times dormant will to first-class citizenship within the Negro community. It is also true that a new conception of our system of courts may arise in the Negro community. In some areas of the country, Negroes view the courts as institutions of repression while in most sections of the South, courts are looked on by them with suspicion, to say the least.

(4) Again, an *ad hoc* appraisal of court action as a means of achieving racial integration in education would suggest it as a potent factor for economic reasons. Since 1940 under the impetus of litigation for equal salaries for teachers, for admission to white graduate and professional schools, and for admission to white public schools, as well as litigation for equal but separate schools, it would be safe to say that the educational plants for Negro schools have been doubled in value, salaries have been almost fully equalized; and curricula, whatever may be said of their quality, have been quantitatively increased significantly. The staggering cost of equalization in a separate system has for the first time been considered by the South as a decisive factor in the whole area of integration. The feverish activity in building elementary and high school buildings, some costing more than \$1,000,000 each, in the South has been a direct result of court action. The extent to which the South can continue this rate of expenditure in an attempt to satisfy the "separate but equal doctrine" has a very definite bearing on the question of achieving integration, even assuming that the courts hold that

equality in education may be achieved in separate racial facilities.

(5) Another effect of court action has been to incite threats, expressed by former Governor Darden of Virginia, now Chancellor of the University of Virginia, and by Governor Byrnes of South Carolina, to withdraw state support from elementary and secondary education and to turn over the plants and programs to private individuals. This threat of course has to run three hazards before becoming a reality. (a) It has to escape court denunciation based on the theory which barred South Carolina from turning over its primary to private citizens by withdrawing all state action with respect thereto. (b) It has to pass the political test. (c) It has to solve the problem of public education for poor whites in the South.

(6) Again court action in those areas where Negroes have been admitted to state universities has indicated the need for integration at the college and preparatory level if Negroes are to be able in significant numbers to compete at the University level. This again poses the whole question of how to deal with segregation: Will integration at these lower levels be achieved without job opportunities free from racial disabilities? Housing, health, cultural opportunities, freedom from fear, all have their bearing on the prospective student. Can we effectively attack segregation in education without at the same time assailing all forms of legal racial segregation? Again, the answer is *no*. Incentive is a prime factor in achievement. Is not segregation itself as a system or way of life antithetical to the democratic way of life?

Education must meet the needs of the

AN APPRAISAL OF COURT ACTION

427

human spirit. In a democracy it must provide the wisdom for minority and majority races to live together on a plane of equality; it must assist in the cultivation of individual and group values consonant with the democratic ideal; it must give each citizen an adequate understanding of the economic institutions, problems and issues in our industrial society; and must enable each person to attain the full development and use by him of his inherent potentiality. We cannot function creatively in an artificially divided society. Freedom of choice and association is a necessary factor in the freedom and dignity of the individual.

In my opinion, it is better for the races to be poorly taught together, in inadequate facilities than that they be taught separately in excellent facilities. The great equalitarian principle of democracy cannot even be taught, much less lived, in a segregated system.

(7) Finally, court action has resulted in some sharp conflicts among lawyers and among laymen as to the legal philosophy and procedure to be utilized in this area.

A very substantial question underlying this discussion is whether it is wise to attack segregation per se as unconstitutional or should a continued attempt be made to whittle away at it under the impetus of an insistence upon equality. In support of the equality approach, it is said that less antagonism is aroused in the community in most instances and that the community is given a choice of either deciding to equalize its schools, or to admit qualified Negroes. To the deep South this appears to be an important choice in the light of its seeming adherence to

the philosophy of the *Dred Scott Case*.

It has been stated in this Conference, "that we should turn over the problem of changing the attitude of the Southerner to the white church South." That proposition failed because of the weak moral position of the intended receptionists. The Conference certainly did not accept that statement.

It has also been said here, "that we should leave a window for the white South to get out of the corner which it is in." We are somewhat suspicious, historically, of whites in the South either coming in or going out of our windows. Hence, the Conference did not agree to that suggestion in any respect.

It has been said here that "we should ask for an end to segregation per se but at the same time we should leave a hole in the case through which the Supreme Court may escape from the necessity of deciding that question". Obviously, this was proposed either in jest or in unfamiliarity with how the Supreme Court works. "The Supreme Court", it is further said, "should be given a chance not to pass on segregation per se if it wishes to avoid doing so. Don't force the court to decide or it may decide that segregation is lawful. That would be disastrous it is said." Why? (1) Our gains are not so great as to require time out for consolidation. (2) Are we expecting a more liberal court in the future? (3) We lost *Corrigan v. Buckley*, after having won *Buchanan v. Warley*, yet we won the *Restrictive Covenant Cases*. We lost *Grove v. Townsend* after winning the *Nixon Cases* yet we won the *Primary Cases*. The greatest thing we have to fear is fear itself. The Conference did not adopt that proposal either.

Again it has been said here, "that we should not put the pupils into white schools until we solve their background differences, educational differentials, and until they can take their teachers with them". It is clear that integration is a much longer process than mere admission. They cannot be done simultaneously. The Conference did not adopt that procedure.

Some have said here that "Court decisions will not be followed if given in cases in certain areas of the South and that some consideration may well be given to concentration of legal action in more favorable sectors." They say, "Pick border states to attack rather than Mississippi or South Carolina." This is the same as saying: "White people in those states are so mean and treat Negroes so badly that they are accustomed to no rights, so let them suffer. The less you have the longer we will force you to accept less." The Conference repudiated that position.

"We have gained so much under the separate but equal doctrine that we ought to pause and consolidate our gains," has been argued here too. In Oklahoma, over 300 students were in the state university, when I was there last summer, all were studying education, and white professors were looking for Negroes to enroll in other schools (17 divisions of engineering for example) and asked us to find some for them in Oklahoma; but the poor public schools for Negroes in Oklahoma had not produced them. In some places, I won't say where publicly, where Negroes were admitted, they have flunked already, not because of race, but because of poor secondary and collegiate background. The Conference

also failed to adopt that proposition.

"That we must wait for ideal plaintiffs, Ph.D. caliber" is another statement made here. Sometimes that caliber of plaintiff may lack the intestinal fortitude or may disdain delay and anxiety and not have the stamina for years of fighting. We must remember that clients seek lawyers and lawyers take plaintiffs as they are. The Conference decided not to wait for such an ideal plaintiff.

Again, it has been said here "that there will be violence and blood will run in the streets". Suppose it does? Shall the Negro child be required to wait for his constitutional rights until the white South is educated, industrialized, and is ready to confer these rights on his childrens' children? The Conference likewise refused to adopt an attitude of fear.

Finally, it was said that "we do not know what motivates the white Southerner in insisting on a denial of equality or opportunity to the Negro." I suppose it makes a theoretical difference whether it is because he doesn't think we are ready for it, rather than that he believes in white supremacy, but to the Negro child it makes absolutely no difference. The Conference considered this question unimportant.

With respect to such a mass of inconsistencies, all I can say is *Nollo Contendere*.

Primarily, I personally disagree with these points of view because I believe that the Constitution gives the Negro the fundamental right to enjoy *now* all benefits offered by the state, without any limitations based on race. Since that is our right, why disguise our fight for it? Why try to sneak upon

AN APPRAISAL OF COURT ACTION

429

it? Why not make a bold assault for it?

I do not agree with any of the reasons given for avoiding a direct attack on segregation as unconstitutional per se nor for the selection of any particular area of the South in which to make the attack. Wherever, the Negro is laboring under unconstitutional disabilities in the South, there is the best place to attack. The attack should be waged with the most devastating forces at hand. Let those who would soften the attack justify the assumption that the people of the United States will support a complete disregard for the decisions of the Supreme Court. The Supreme Court will have to worry over community attitudes. Let us worry over the problems of pressing for our civil rights. Let the Court decide the wisdom of declaring segregation per se unconstitutional. Instead of worrying over the effect of compelling the Court to decide, our real concern is, how we may best compel the Court to decide the question. Let the Supreme Court take the blame if it dares say to the entire world, "yes, democracy rests on a legalized caste system. Segregation of races is legal." Make the Court choose. Let the Court make a national and international record of this. Let the Court write this across the face of the Constitution: "All men are equal but white men are more equal than others." We are not isolated as in a vacuum. The imposition of segregation is a departure from the obligations of the Charter of the United Nations and is inimical

to our international relations. In the attempt by the whites of the South to cling to *Dred Scott* and *Plessy*, the 20th century is against them; world politics is against them; the self interest of the United States is against them; and, the Constitution of the United States is against them. In the twenties and thirties the legal fight to remove disabilities affecting the Negro was waged in a much more hostile climate than exists today.

Chief Justice Vinson said in the Sipuel Case "Petitioner is entitled to the enjoyment of her constitutional rights now."

In conclusion, may I suggest to you that the sharp challenges that are now presented to the ideals of the revolution of 1776 by the "ideals" of another revolution of 1917 ever press us toward the necessity for the development of a "more perfect union" and a more perfect democracy. In that democracy, segregation cannot exist. Racial integration in education is one of the basic requirements. Slow and tortuous as are our courts, thus far, a resort to them has been invaluable. No one has yet suggested a better way to outlaw legalized racial segregation in education than by a resort to the courts. I propose that an all-out assault on legalized segregation in every field—wherever it exists in this country—be made without hesitation or fear. If the Court refuses to declare segregation per se unconstitutional, the equality approach with all its basic weaknesses still remains.

MR. THOMPSON: Dr. Nabrit, you almost made it (laughter).

When we were mapping out this program and got down as far as we

are now, we thought that the program would be complete. But some intuition kept recurring which made me feel that the program was not complete. I

asked several people what was wrong; I said, "I feel that there is something missing here which should be included."

About this time I had occasion to be in Chicago. I went out to the University of Chicago to see Louis Wirth. I discussed the problem with him. Finally, I said, "What is missing here, what suggestion do you have to make?"

He said, "You know that after you get a favorable court decision you do not necessarily get integration. We are working on just that very problem here in Illinois. We have a law which says that you cannot segregate and yet we have segregated schools. So we still

have the problem of developing the cooperative acceptance of racial integration in many communities in Illinois."

I pursued the matter further by asking him, "Who is the best available person in the country to present that subject at our Conference? He suggested several people but always came back to one man, and that man was Father LaFarge.

(Thereupon, Mr. Thompson introduced Reverend John LaFarge, S. J., *Associate Editor of America*—A National Catholic Weekly.)

THE DEVELOPMENT OF COOPERATIVE ACCEPTANCE OF RACIAL INTEGRATION

JOHN LAFARGE, S. J.

Associate Editor, America

Dr. Johnson, Chairman Thompson, ladies and gentlemen:

Coming from New York one feels a certain diffidence about speaking in Washington. You always feel when you come to Washington that you really ought to be listening rather than talking. But I understand that nothing that is said here is secret or classified, so I guess we are all right (laughter).

I appreciate very much Dean Thompson's flattering introduction, but I can get back at him again by saying that in the books he has mentioned, most of the material was taken from the *JOURNAL OF NEGRO EDUCATION* (laughter). Just poring over the *JOURNAL OF NEGRO EDUCATION* I came to the conclusion that one could take some facts out of there and maybe get away with it and he would know where one got it. But I do congratulate him upon both the success of this conference and his own publication. Magazines do not run of themselves and they do not

run by any automatic process, they only run by the good will of the public; and if *THE JOURNAL OF NEGRO EDUCATION* were to go, which I hope it never will, we would lose a terrific ally in the fight for justice and parity.

I want to say that I enjoyed immensely the wonderful summary made by Professor Jenkins. And I was very much intrigued by all the things that Dr. Nabrit said were not adopted (laughter).

Acceptance by the community, when racial integration has been achieved, is obviously a matter of the utmost concern. So much has already been indicated on this topic, of theory and of general experience, that I need not go over that familiar ground. My only function is to speak from personal experience.

There are, as I see it, two approaches to the subject: one direct, the other indirect.

We do need to assert directly cer-

CHAPTER XVIII

THE STATUS OF EDUCATIONAL DESEGREGATION, 1956:
A CRITICAL SUMMARY

PRESTON VALIEN

Chairman, Department of Social Sciences, Fisk University

In reviewing the status of educational desegregation in the year since the May 31, 1955, implementation decree of the U. S. Supreme Court, one is struck by the predominance of what appears to be two strongly contradictory developments. On the one hand, the period has been marked by a growth in organized opposition to the Supreme Court's decision which, in the Deep South, approaches anarchy in some instances and overt subversion of the national government in others. Yet, the period has been marked also by important legal victories for desegregation (even in the Deep South) and by significant progress in desegregation of activities outside of education. While these two developments may appear to be contradictory and unrelated, one can hardly escape the feeling that both the growth of organized opposition to the decision and the resort to the machinery of the courts for implementation of the decision are products of the same set of consequences: (1) the general failure of Southern political leadership to take a responsible position based upon moral convictions or upon respect for law and order and (2) the general inability or unwillingness of other white Southern leaders, especially the so-called moderates who profess either moral convictions against segregation or a respect for law and order, to take collectively a position counter to that of the political leadership in the arena of public opinion.¹ Given these

conditions, one should not be surprised at the growth and continuation of organized opposition to the application of the law of the land nor at the feeling on the part of supporters of the decision of the necessity to utilize the power of the courts to effect its implementation.

OFFICIAL OPPOSITION TO THE DECISION
IN THE SOUTH

The official opposition to the implementation of the Supreme Court's decision has tended to focus more upon legal inventions of various types, while extra-legal economic and social sanctions which were prominent at one time now appear to be receiving less emphasis. The legislatures of the strongly defiant states have established state agencies specifically directed to find means to circumvent the decision. Mississippi, for example, has established a State Sovereignty Committee with an appropriation of \$250,000 and with the authority to employ secret investigators and informants in combating desegregation. Georgia has The Georgia Education Commission for the same purpose, and Louisiana has the Joint Legislative Segregation Committee with an appropriation of \$100,000 to pay attorney fees to fight desegregation. South Carolina has a School Segregation Committee first appointed in 1951 by Governor James F. Byrnes and extended indefinitely by

or progressive imagination" in Southern politics, see Ralph McGill, "The Angry South," *The Atlantic Monthly*, pp. 31-34, April, 1956.

¹ For an explanation of the lack of "idealistic

the 1956 legislature to study ways and means of maintaining segregated schools. The committee has authorized a legal staff of a chief counsel and four or five assistants. North Carolina has its Advisory Committee on Education and Virginia has its Gray Commission.

The legal devices which these committees and others have developed aim either to permit the continuation of segregated public education by evasive techniques of various types or to abolish the public school system.² These legal devices have been generally confined to those states where no public school desegregation at all has taken place prior to or since the Supreme Court decision. Seven states (Alabama, Georgia, Louisiana, Mississippi, North Carolina, South Carolina and Virginia) have adopted resolutions of interposition or of nullification, and proposals for adoption of such resolutions have been made in other states, although these are widely admitted by many of their proponents to be designed chiefly to influence and stiffen public opposition against desegregation and the United States Supreme Court.

The legal proposals to circumvent educational desegregation include: (a) giving local authorities the power to assign each individual pupil to a specific school, (b) measures making it illegal for teachers, students or school officials to advocate or to implement desegregation, (c) state constitutional amendments and laws disclaiming public education as an individual right or as a state obligation, (d) laws to censor books which appear to support desegregation or racial equality, (e) laws

abolishing compulsory school attendance, (f) measures requiring teachers to sign segregation loyalty oaths and to refrain from joining the National Association for the Advancement of Colored People (NAACP), (g) regulations restricting teacher appointments to a year-to-year basis and (h) measures to provide for the abolition of state public school systems. The Georgia State Board of Education adopted two resolutions which would have revoked "forever" the Georgia teaching license of any teacher who approved of or agreed to teach racially mixed classes or held membership in the NAACP. While the president of the Georgia Education Association (which is composed of white teachers) supported the resolutions, strong opposition from the press, the Atlanta Council of United Church Women, the Georgia League of Women Voters and other groups caused the resolutions to be rescinded in a subsequent meeting of the State Board. Instead the board decided to require teachers to sign an oath to "uphold, support and defend the constitution and laws" of Georgia. Two new textbook committees appointed by the Georgia State Board of Education examined books and other reading materials in the Georgia school system for "anti-southern bias" and general merit. Charges were also made that certain books were "un-Georgian." In South Carolina a concurrent resolution requested the State Library Board to remove from circulation certain books "antagonistic and inimical to the traditions of South Carolina."

Of the various legal proposals designed to continue educational segregation, one of the most widely adopted or proposed has been the transfer of all authority over assignment and enroll-

² See the excellent discussion of these legal devices in James M. Nabrit, Jr., "Legal Inventions and the Desegregation Process," *The Annals*, 304: 35–43, March, 1956.

EDUCATIONAL DESEGREGATION, 1956

361

ment of pupils to superintendents or local school boards, and in at least one instance, to the sheriff. Assignment bills have been proposed or adopted in Alabama, Georgia, Florida, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee and Virginia. These proposals usually state that pupil assignments will be made commensurate with the personality, welfare, happiness, and ability of the child or with public peace, safety, health and morals of the people of the district. They usually provide a long and expensive appeal procedure, but since the ultimate objective is racial segregation, even their proponents usually admit that the establishment of their legal invalidity is merely a matter of time. As a matter of fact, these proposals contain the self-defeating element that the more effective they are in achieving their objective of racial segregation, the easier it will be to establish the case for their legal invalidation.

THE RESISTANCE GROUP MOVEMENT

The extra-legal resistance movements to desegregation (White Citizen Councils, Federations for Constitutional Government, Ku Klux Klan, etc.) achieved their greatest growth in the "do nothing" and "wait and see" period following the Supreme Court's 1954 decision. They vary widely in composition, philosophy and effectiveness. One of the interesting reflections of the present low state of political integrity and legal ethics of some Southern political leaders is the fact that some of the Southern attorneys and political leaders in Arkansas, Florida and other states who are credited with influencing the U. S. Supreme Court to grant their states time for adjustment in its implementa-

tion decree are now among the leaders of the resistance movements in their states. While the resistance movements include such leaders, other segments of it include the educationally and economically underprivileged whites of the Ku Klux Klan type. The philosophy of the movements ranges from a single-minded concern over desegregation and "racial mongrelization" to opposition to Jews, Catholics, foreign-born, the mental health movement, fluoridation, and the United Nations. In some manner, through opposition to these diverse elements, the mystique of the maintenance of the racial purity of white blood is fused with a concern for states' rights which leads to influential political activity. Fleming³ has listed at least twenty pro-segregation groups in the South and points out that in at least four southern states political control is in the hands of politicians who are wholly sympathetic to the aims and methods of the resistance groups, while in four additional states the resistance groups exert strong political influence on the legislature and upon political office holders. It is more than coincidence that the political leaders within the resistance groups come from areas which deny or severely restrict the voting rights of Negroes. These restrictions have been extended to whites where it was necessary to do so in order to prevent Negroes from registering and voting.

The activities of the resistance groups have served to once more point the moral that freedom is indivisible, and the only way to preserve it for any one is to oppose attempts to deny it to others. The intimidations and

³ Harold C. Fleming, "Resistance Movements and Racial Desegregation," *The Annals*, 304: 44-52, March, 1956.

reprisals which were first inflicted upon Negroes have quickly been extended to white citizens who have dared to express sentiments in favor of compliance with the Supreme Court's decision. Clergymen have been denounced and dismissed, teachers have been fired, students have been censured. Protestant churches have been attacked in Georgia for opposing segregation, while Catholic churches have been threatened with restrictive legislation in Louisiana to prevent desegregation of their church schools. Mississippi has passed a bill requiring all teachers, white and Negro, to submit affidavits listing memberships held in all types of organizations during the past five years. Reports indicate that only the Negro teachers opposed it. Religious Emphasis Week was cancelled at the University of Mississippi when the speakers who included several religious leaders would not consent to keep silent if questioned on segregation in their discussions.

The tragic element in this situation is the failure on the part of the white community to recognize the need for organized counter-resistance not to protect the Negro but to protect their own democratic rights. When a prominent editor of a leading weekly news magazine which apparently has decided to take a leading role in supporting racial segregation writes of conformity by coercion⁴ he interprets coercion as the use of the law to *prohibit* racial segregation in public facilities, but he fails to recognize as coercion the reverse instance of the use of the law to *enforce* racial segregation in public facilities. No coercion is seen, for example, in the laws and actions of state

officials and agencies in Virginia, North Carolina, Florida and Texas which prohibit or attempt to prevent communities in these states which desire to comply with the law from doing so. In stating that prejudice cannot be legislated out of existence, he fails to see that it is not prejudice but behavior which is being regulated and seems unaware of the fact that supporters of racial segregation have long used the law to regulate the same behavior which they now say can not or should not be regulated by law. This editor and other supporters of racial segregation generally fail to see any element of coercion in the unanimity with which pro-segregation resolutions and laws are passed in southern state legislatures. They fail to see any coercion in the resignation under pressure of the young white editor of a daily paper in Florence, South Carolina, who had called for moderation on the desegregation issue. This young white editor said upon resigning, "Our Southland is becoming a place where non-concurrence with the established orthodoxy is cause for rejection and social ostracism."⁵ The region and the nation still await an organized collective expression of those in the South who believe that the Supreme Court decision was morally or legally justified or, who, while believing neither, still feel that law and order should prevail. To those who raise the oft-heard query as to expediency and safety, one can only say with Benjamin Franklin that "those who give up essential liberty to obtain a little temporary safety deserve neither liberty nor safety," and one can further say that history establishes that they usually achieve neither.

⁴ *U. S. News and World Report*, p. 140, July 6, 1956.

⁵ *Time Magazine*, p. 50, July 30, 1956.

EDUCATIONAL DESEGREGATION, 1956

363

SIGNIFICANT LEGAL VICTORIES FOR
DESEGREGATION

Despite the growth of the resistance groups and the fact that they often receive support by the executive and legislative branches of the state governments and even the state judiciary in some instances, several important legal victories have been won in the federal courts. In Alabama, a federal judge ordered the admission of Miss Arthurine Lucy to the University of Alabama. She was admitted for three days and subsequently expelled as the result of a series of developments after mob action forced her to leave the school. In Arkansas, the federal courts issued a permanent injunction restraining a resistance group from interfering with the Hoxie School Board in the implementation of its desegregation program. When this resistance group appealed the decision, the U. S. Department of Justice announced that it will enter the case on the side of the school board as a friend of the court. The significance of this is readily apparent. Another significant legal victory was won in Florida by Virgil Hawkins, a Negro, who had been seeking admission to the University of Florida Law School for more than six years. The United States Supreme Court has directed that Hawkins should be admitted not later than this fall, although Florida is still appealing the decision. In Louisiana, a federal judge invalidated all school segregation laws passed by the legislature in 1954. In Virginia, a federal judge has recently directed that Charlottesville begin desegregation of its schools this fall. While West Virginia has made significant progress in desegregation, in a case involving Greenbrier County, a federal judge followed a pattern

which is becoming standard procedure in school segregation cases:

1. He ruled that threats of violence regarding desegregation did not constitute reason for non-compliance.
2. The suit was judged as a class action and not one of individuals.
3. State segregation laws were declared voided by the United States Supreme Court decision.
4. He established a deadline for compliance by the school board.

One of the significant aspects of the cases relating to colleges and universities which have reached the U. S. Supreme Court has been the clear indication by the court that its policy of gradual implementation of educational desegregation at the elementary and secondary level did not apply to the higher education level where immediate admission of qualified Negro applicants is usually ordered.

In spite of the growth in strength of the resistance movements, desegregation in education made substantial progress during the preceding year. While no public elementary or secondary school desegregation has occurred in Alabama, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee and Virginia, the federal courts have ordered local school districts in Tennessee and Virginia to begin desegregation by this fall. In addition, court orders directing the admission of Negroes to formerly all-white publicly supported colleges and universities were rendered in Alabama and Florida for the first time. In several other states new court decisions and administrative rulings widened already existing enrollment opportunities for

Negroes in publicly supported institutions. According to a survey made in 1956 by *Southern School News*, half of the 208 formerly all-white publicly supported colleges in the South were open to Negroes and 93 of the 104 were reported to have Negro students.⁶ Only Florida, Georgia, Mississippi, and South Carolina were found to have had no Negroes enrolled in their publicly supported all-white colleges. It should be noted also that many formerly all-white privately supported and church-related colleges in the South have been opened to Negroes.

A significant development has been the growing enrollment of white students in formerly all-Negro colleges where these colleges are strategically located and have good academic reputations. The outstanding example of this is West Virginia where there were 185 white students attending two colleges formerly for Negroes in the fall of 1954, and this number had increased to 513 by the second semester of 1955–56. Lincoln University in Missouri, formerly a state-supported institution for Negroes, reported approximately 200 white students during 1955–56 or approximately one-fifth of the total enrollment. Similar developments have been reported for other colleges, especially private colleges such as Fisk University in Tennessee and Talladega College in Alabama.

Eight southern and border states which at the time of the 1954 Supreme Court decision either required or permitted segregated public education have begun the desegregation process. Arkansas initiated desegregation in Charleston and Fayetteville in 1954–55 and in Bentonville and Hoxie in 1955–

56. The Hoxie situation has been previously mentioned as one of the significant developments in the desegregation picture during the year. Desegregation has also taken place in Delaware, the District of Columbia, Kentucky, Maryland, Missouri, Oklahoma, Texas and West Virginia. These areas can be divided roughly into two groups: one group is still trying to bring about pupil desegregation and has not gone beyond this level, while the second group has gone beyond this level and is facing in various ways the problems of teacher integration, pupil achievement, interscholastic athletics, and the general inadequacies of the school system. The problems of pupil achievement have usually centered around the fact that Negro students have been found to be from two to three years behind white students in achievement on standardized tests. While most people attribute the low scores of Negro children to the results of inferior segregated schools, it is interesting to note that others use this as a “vicious circle” argument for continued segregation, claiming that desegregation will reduce academic standards in formerly all-white schools. Such claims are usually not accompanied by any explanation as to how continued segregation will eliminate the conditions which past segregation is stated to have created.

Teacher Integration

The problem of teacher integration has been greatly conditioned by the fact that in general desegregation has been a unilateral process with Negro pupils transferring to formerly white schools, but with little of the reverse occurring. To a large extent this is merely a reflection of the inequality which characterized Negro educational

⁶ *Southern School News*, March, 1956.

EDUCATIONAL DESEGREGATION, 1956

365

opportunities and facilities under the "separate but equal" philosophy. The result has been, however, to make the position of the Negro teacher more insecure than that of the white teacher, especially in rural areas where desegregation meant abandonment of the Negro school, or in states where teacher tenure laws are weak or non-existent.

A review of the situation as presented in the reports of this Yearbook indicate the following with respect to teacher integration:

Delaware—Wilmington represents the only instance of faculty integration, but previously all-white state and county teachers' associations are integrated except in Sussex County.

Kentucky—Dismissal notices have been received by 60 Negro teachers. Two Negro teachers are instructing mixed classes. There has been a continuation of the employment of white teachers with emergency certificates in areas where Negro teachers with permanent certificates are available. This has been done in spite of the fact that school boards in hiring teachers with emergency certificates must certify that no teachers with higher qualifications are available. The State Board of Education has requested school boards to give due consideration to all qualified applicants for teaching positions. Louisville and Fayette County superintendents have been quoted as saying that Negro teachers will probably be instructing white students in their systems at some future time. In Fayette County, several Negro teachers have been assigned non-

teaching positions for next year as librarians, remedial reading instructors and record keepers in integrated schools. White and Negro teacher organizations of the state have merged their records and finances, with Negroes accepted as full and equal members. The merged organization, the Kentucky Education Association, promised to work for the rights and welfare of *all* teachers.

Maryland—No teachers have lost their jobs as a result of desegregation. While Baltimore began cautiously in 1954 with the use of 7 Negro teachers in white secondary schools, these were increased in 1955 to 81 Negro teachers in formerly white secondary schools and 26 Negro teachers in formerly white elementary schools. The Maryland State Teachers Association deleted the word "white" from its constitution in 1952, thus admitting Negroes to full membership.

Missouri—The plight of the Negro teacher is difficult outside of the two large cities of St. Louis and Kansas City. No jobs were lost in St. Louis because of desegregation, and the situation there is better than in Kansas City where 59 Negro reserve teachers were not being used despite a need for teachers in mixed schools. Several cities and school districts have integrated Negro teachers or have announced plans to do so. These places include Independence, Jefferson City, Springfield, Carthage, Festus, Kirkwood, Parkway, St. Charles and St. Joseph. On the other hand, Negro teachers have

been discharged at Moberly, Slater, and Hannibal. Legal action has been instituted by the Negro teachers of Moberly. The state teachers' association has been integrated since 1949.

Oklahoma—Teacher integration has barely made a beginning. It is estimated that 165 Negro teachers have been dismissed because of desegregation, and the Governor and other state officials have evinced sympathetic concern. A Negro teacher has been hired in Cushing and one in Wellston to teach mixed classes. The Oklahoma Association of Negro Teachers and the Oklahoma Congress of Negro Parents and Teachers voted to disband during 1955–56 and to affiliate with the formerly all-white organizations.

Texas—It is reported that 19 Negro teachers lost their jobs in Texas because of desegregation. No teacher integration was reported.

West Virginia—White teachers in integrated classrooms increased from 897 in 1954–55 to 1795 in 1955–56, while Negro teachers in integrated classrooms increased from 15 to 102 over the same period. It is estimated that 15 Negro teachers were not reemployed at the end of 1954–55, and 10 were not reemployed at the end of 1955–56. Most of the counties planning to desegregate will apparently retain their Negro teachers. On the other hand, in no West Virginia county was any new Negro teacher employed in an integrated school, although the need for teachers was so acute that many persons holding sub-stand-

ard certificates were employed. The state teachers' association is integrated.

It should be pointed out that wherever teacher integration has been attempted, there have been no serious incidents or complaints on the part of pupils or parents. In recent weeks, a new element has been injected into the teacher picture by the New York City school system's public announcement that it will recruit qualified teaching applicants from among those teachers dismissed in southern states.

Some Broader Perspectives

Reviewing developments in the desegregation picture from a perspective of two years since the United States Supreme Court's decision of 1954, the following observations may be offered:

1. There has been a general failure on the part of many of our regional and national leaders to perceive and to make clear that changes in race relations in the United States are intimately related to our national security and to our position of world leadership. John F. Melby, writing from a background of long service in the United States Foreign Service, states: "At the outset let it be clear: the evil part of the American record on racial policies, especially in the light of our profession, is a major blot on our escutcheon, and it does positive and serious damage to the whole cause of freedom and democracy in these days in which the United States has emerged into a position of world leadership. . . . Undoubtedly what Mississippi does about its school system worries New Delhi more than it does Chicago."⁷

⁷ John F. Melby, "Racial Policy and Interna-

EDUCATIONAL DESEGREGATION, 1956

367

Ralph McGill underscores the need for an understanding from this perspective when he writes, "Many a sincere, average deep-South Southerner does not know, or refuses to admit, that world forces are at work in the American race problem as they are in Asia and Africa. Somehow, to him, his present harassments are all a sinister business brought on by an organization called the NAACP. He feels that a proper government would put it in jail or order it to go away, and then everything would again be as it was. One of the more unrewarding tasks of a responsible Southern journalist is to interpret local events, when he can, in terms of the world picture."⁸

2. The structure of legal racial segregation has been further weakened during the past two years by the extension of the principles of the school segregation decisions to other areas of activities. On November 7, 1955, the Supreme Court, in effect, applied to public parks, golf courses and beaches the principle that separate facilities are inherently unequal. During January, 1956, the Interstate Commerce Commission directed railroads and bus lines to discontinue the racial segregation of interstate passengers. On April 23, 1956, the U. S. Supreme Court refused to review a case in which racial segregation on buses operated within the city of Columbia, S. C., had been held to be unconstitutional. While some confusion developed later as to the exact meaning of the decision, many southern communities moved immediately to desegregate their

bus lines and have done so without any reports of serious incidents. There is little question that the removal of segregation in one area of activity makes more difficult its justification and maintenance in other areas of activity.

3. The increasing urbanization and industrialization of the South contain within themselves forces designed to destroy the "southern way of life." All over the South the attraction of new industry and new businesses has become a major preoccupation, and reports that racial tensions are slowing up this expansion have occasioned a rash of denials that this is true and a series of warnings that caution should be exercised lest it happen. Governor LeRoy Collins of Florida stated, "Believe me when I say Florida cannot afford an orgy of race conflict and discord. I have talked to many here and in other regions of the United States now poised preparatory to making substantial investments in Florida. Nothing will turn these investors away quicker than the prospect of finding here communities hepped up by demagoguery and seething under the tension and turmoil of race hatred." A Boyd Campbell of Mississippi, president of the U. S. Chamber of Commerce, has also expressed the belief that racial tension could result in a slow-down in the industrial development of the South. It is interesting to note that the southern entrepreneurs who desperately seek new industries and payrolls for their communities generally fail to recognize that they are accelerating the very social changes which they so strongly deplore.

tional Relations," *The Annals*, Vol. 304, pp. 132-136, March, 1956.

⁸ Ralph McGill, *op. cit.*, p. 34.

4. A final observation is warranted on the growing consciousness and utilization of the Negro of his economic power. The bus boycotts in Montgomery and Tallahassee and economic boycotts in Orangeburg and other places have demonstrated a remarkable effectiveness and unity of purpose. In some instances such as in South Carolina the legislatures themselves have given Negroes potent weapons. The repeal of the compulsory school attendance law enabled Negroes of Jasper County, South Carolina, to withhold their children from school to effect im-

provements without fear of legal reprisals. It is reported that the drop in average daily attendance figures threatened to curtail the budget of the white schools and brought quick promises of improvements. Accompanying their consciousness of their economic power, Negroes have invested their fight against segregation with a spiritual conviction and an amazing display of courage which in the long run may be the most significant determinant in the eventual successful accomplishment of the desegregation process in American society.

CHAPTER XI THE BUSING OF STUDENTS FOR EQUAL OPPORTUNITIES

THOMAS W. MAHAN

*Director, Project Concern, and Director, Institute for Human Development,
University of Hartford*

THE PROBLEM — AND SOME EFFORTS TOWARD SOLUTION

The evolution of the concept of "busing" as a technique for increasing the probability of equal educational opportunity for black or other minority youth comes from two rather distinct sources. The first of these has lost some of its popularity in recent months and revolves about the role of the public school as a dynamic force in the acculturation process. It views the strength of the society as an outgrowth of its ability to absorb divergent, even conflicting, traditions and forge a "mainstream" which can be "owned" by all segments. With the repeated failure of the white educational establishment to demonstrate the viability of this concept (except on very paternalistic terms) and the growing sense of alienation between white and black traditions, this basic premise has been seriously questioned especially by the black community. This problem will receive more attention later.

The second source for interest in "busing" is a more empirical one. Public school research bureaus are filled with data (long zealously ignored) which underline the limited output (as measured in terms of achievement, mental ability or social adaptation) of the ghetto school. Even beyond this the cumulative, if not definitive, impact of efforts in the areas of enrichment and intensive compensatory programs has provided little basis for

hope that the relatively easy solutions such as smaller classes, better teachers, new facilities, revised curricula or combinations of these will correct the problem. In other words, "busing" is an intervention which faces up to the evidence about the overwhelming burden which faces the neighborhood school in the ghetto; that is, it faces all the facts except that of numbers. Once again this issue will be delayed until later.

Yet to write about "busing" even within this context is too general. For example, does this concept include those operations which transport Negro youngsters from a highly segregated school to a less segregated school only to place them into highly segregated classes because of the principle of homogeneous grouping? For the purposes of this paper "busing" will be limited to those programs which transport ghetto youth into essentially white schools and place them in classes where they are a clear-cut minority (less than 25% of the total class). This arbitrary definition is invoked because it seems essential to clarify the issues: busing is here viewed as an intervention designed to enhance the performance of ghetto youngsters along the dimensions of traditional school success. This in no way implies an unawareness of the philosophical or value issues involved, but it does involve an immediate, pragmatic orientation: within the present system ghetto youngsters have few, if any, alternatives

and the range of possibilities for subsequent movement is extremely constricted. In the long run it may be that the public school system will be dramatically changed and its relation to higher education and occupational structure much altered; in the meantime it exists and demands recognition.

At this point it may be well to set forth the rationale behind the intervention. Clearly, there is no magic in sitting next to a white child that suddenly transforms the non-white child into a better student. Rather, the assumptions have to do with styles of learning, reinforcement, level of expectations and modeling. In brief, the ghetto child enters school with a "style of learning" which does not generally facilitate school success. Because of the homogeneity of the ghetto school this style or pattern is reinforced by the general population and eventually the expectation is that this pattern will persist and dominate. In contrast, when the ghetto child is placed in a suburban school, his crystallized pattern is confronted with new situations and reactions. There is a tendency for the pattern to become less stable because of different response sets and different expectations. Theoretically, the change will be in the direction of the other models present — particularly if supportive assistance is provided in the initial explorations. In other words, it is felt that the characteristics of the majority of the pupils in a classroom are a powerful determinant of individual pupil behavior and of teacher interaction, including teacher expectation. Viewed in this light busing constitutes a frontal attack upon two highly-valued educational myths: the neighborhood school and homogeneous grouping.

The present paper is an early survey of four attempts to introduce quality education by way of busing. The choice of case studies is primarily a function of availability of data although the major emphasis has been placed on urban-suburban plans because these most dramatically illustrate the problems and promises of this intervention. The urban communities involved are Boston, Hartford, and Rochester, New York, all of which have ghetto youth now attending schools in white suburbs and White Plains, New York, which has introduced an extensive intra-city program. Table I summarizes some of the information about these communities and their plans.

Clearly, the size of the programs is limited and each of the urban-suburban efforts has been characterized as a "pilot" endeavor. Within this context it appears that there are some beginning signs of breakthrough. Boston's METCO program continues to expand and will reach a figure of 800 pupils in 22 towns by September, 1968; in similar fashion Hartford's Project Concern is now assured of a program of 1000 pupils in 11 communities — a figure which is approximately 13 per cent of the total nonwhite population in grades K — 6. These figures, however, take on much more meaning in the light of the difficult road to existence.

THE QUEST FOR A DREAM: A BRIEF HISTORY

The American dream of equal rights and equal opportunity has been shattered in the ghetto schools of our major cities for years and yet it has continued to persist. This dream has been part of the motivation which has led to busing, but it has had to overcome a series of impressive obstacles. In each of the com-

BUSING STUDENTS FOR EQUAL OPPORTUNITIES

293

TABLE I
DESCRIPTIVE DATA ON FOUR COMMUNITIES

Program Title	Year Initiated	Nonwhite School Population	No. of Children	No. of Towns
Boston METCO	1966	24%	220 (1966) 425 (1967)	7 15
Hartford Project Concern	1966	56%	266 (1966) 284 (1967)	5
Rochester	1965	28%	64	1
White Plains	1964	18%	750 (est.)	N.A.

munities which are mentioned above there has been active, vigorous objections to the concept of busing. The form of the objection has followed a rather consistent pattern with voiced objections taking the following lines: (a) it is the city's problem and let them solve it, (b) if "they" want to move out there, let "them" work their way up as we did, (c) busing will dilute the quality of our suburban schools, (d) the disparity of experience will be psychologically traumatic, (e) "they" will be happier in their neighborhood schools, and (f) it would be better to spend the money for improvement in the ghetto school.

Beneath these objections as they were voiced in crowded and often tumultuous public hearings was an intensity of feeling which appeared to bring serious disharmony into the community. It seemed obvious in most suburban towns that a popular plebescite would result in rejection of the plan. Consequently, the cry for a referendum was frequent and loud: "let

the people decide," was the plea. In each of the three states involved (Connecticut, Massachusetts, and New York) the statutes clearly placed the responsibility for such decisions in the hands of the boards of education or school committees. In Connecticut, a number of towns requested rulings from their legal officers as to the legality of an "advisory referendum" which would have no binding force but would give the board of education the benefit of the town's opinion. In four towns the legal authorities declared that such an action would not be legal; in two others the decision stated that, if no expense was involved (i.e., if the question were placed on an already scheduled ballot), it would be legal, but not binding. As a result, two such "popular votes" have been held with results given in Table II. This illustrates the fact that even in a town which has had two years of successful experience in the program and where the local school authorities have gone on record as enthusiastically supportive, there

TABLE II
DISTRIBUTION OF "POPULAR VOTES" IN TWO TOWNS ON THE ISSUE OF Busing

Town	Question	% Voting	% Favor	% Opposed	Final Decision
Bolton	To Join	38	40	60	Joined
Manchester	To Continue	35	49	51	Continued

remains much divergence of feeling within the town.

Yet in some ways these figures are misleading. The natural history of events seems to follow a rather determined sequence. There is the excited, turbulent period charged with emotion and attack; the predictions of dire results (and perhaps reprisals in the form of opposition to bond issues, etc.) may accompany the courageous decision of the school authorities to move ahead. Then comes a period of watchful waiting coupled with a sense of surprise when the largest problems turn out to be logistical (how to get the buses to be at the different places at the same time, for example). When the question is again formally before the board of education to decide upon continuation, it now evokes limited interest. Where in the beginning, 2,000 taxpayers may have turned out for a meeting only 25 to 50 come, and statements are simple, to the point, and without vindictiveness.

This simplified and generalized account in no way conveys the tremendous pressures which are exerted in the midst of the controversy nor the remarkable sources

of support which are sometimes rallied. These will probably vary from town to town, but it seems safe to infer that at least some elements of the "power structure" must encourage participation if there is to be substance to the proposal. The alignment of the liberal "civil rights" groups or those commonly dismissed as "do-gooders" is essential, but not sufficient in itself.

OPERATIONAL DESIGN: AN OVERVIEW

Each of the four places considered by this paper has a basic similarity in that nonwhite youngsters (mostly black, but including Puerto Rican) are placed in predominantly white schools where there is room. In White Plains where the program is contained within the city limits, the plan called for the closing down of a core city school and dispersion of these youngsters into the other ten elementary schools with certain guidelines as to ethnic percentages. This procedure is most directly contrasted with Hartford where there are eight elementary schools containing 12,000 youngsters that are 90 per cent or more nonwhite. Under such conditions, where the total school population

BUSING STUDENTS FOR EQUAL OPPORTUNITIES

295

is 56 per cent nonwhite, the closing of schools and redrawing district lines will not work. For Hartford, time had made that approach obsolete. Yet, in a sense, the suggested solution was the same except that it called for a redefinition of the geographic limits of the community. Perceived in this way each of the plans is similar with the following exceptions:

- A. Only in White Plains has the action solved the segregation problem; in the other three communities only the possibility of a solution has been demonstrated.
- B. The youngsters involved differ
 - 1. White Plains — all the pupils of one inner-city school and 20 per cent of other elementary schools have been reassigned to create reasonable uniformity in ethnic balance.
 - 2. Boston — volunteers were solicited through various media and applicants selected by interview.
 - 3. Hartford — random selection from all segregated schools.
 - 4. Rochester — selection by school authorities.
- C. The grade levels involved differ in that Hartford and Rochester bus only elementary school youngsters (although in 1968-69 Hartford will include secondary school youngsters who have completed two elementary school years in the project), White Plains reassigned only elementary school youngsters since its secondary schools were already integrated and Boston buses youngsters through senior high school.
- D. The research implications differ in that Hartford's Project Concern was

initiated as a research study of the effectiveness, and a design involving a comparison group of controls within the inner city has been carefully implemented; in the other three plans evaluation procedures have been continually developed but a research design has been lacking.

- E. Hartford has operated an experiment within an experiment in that it has provided a supportive team (teacher and paraprofessional aide) to supplement the suburban school's resources in some instances and not in others in the hope of being able to determine whether suburban placement or supportive assistance or both is the "treatment of choice."

Still, within these program differences, the operation has been similar. Black youth are "bused" to white schools and are given the encouragement and opportunity to partake in all school related activities. In other words, an effort is made to re-create the advantages of the neighborhood school (after-school activities, parent involvement, school-community programs such as scouting or religious instruction) in a school which is not within walking distance.

THE EFFECTIVENESS OF BUSING: SOME TANTALIZING RESULTS

An effort to report on the four programs is exceedingly difficult because of the differences mentioned above. However, each program does provide at least some beginning data from which to assess its effectiveness and these data will be presented here within a framework of areas of concern. However, before setting these forth it might be well to sketch the characteristics of youngsters and fam-

ilies in *Project Concern* since this program will provide a larger proportion of the evidence available. Since the Hartford children were randomly selected, they provide a good base from which to make inferences for future efforts. The following figures were given by the parents to interviewers:

Living Situation

Mother & Father, 56%
 Mother only, 37%
 Step parent(s), 4%
 Other than parent, 2%
 Father only, 1%

Parental Birthplace

Connecticut, 18%
 Other North, 6%
 South, 65%
 Puerto Rico, 17%

Number of Siblings

1-3, 23.5%
 4-6, 44.5%
 7 or more, 32%

Income Source

Both Parents, 23%
 Father only, 36%
 Mother only, 12%
 Welfare, 36%

In addition to the data given above, it is relevant to note that 94 per cent of the families live in multi-family rental situations and that only two parents report themselves as above the unskilled or semi-skilled occupational scale.

What Is the Reaction of the Black Community?

A major question in the development of busing programs continues to be the conflict over the desires of the Black community. In the light of their increased sense of separation and the continuing

gulf between white opportunity and black opportunity, many Negro leaders have stated a preference for separatism and local (i.e. Black) control of schools. Yet, with this cry much in the news media, the burden of the evidence suggests that most Negro parents see the white school as providing increased educational opportunity for their children. Some of the indicators of this feeling are:

(a) In an anonymous questionnaire in White Plains 66 per cent of the respondents from the predominantly Negro school indicated that they saw only positive effects from the plan, 28 per cent saw "no difference" and the remainder reported both positive and negative effects.

(b) In Rochester a visiting team of professionals from the New York State Department of Education interviewed parents of children being bused to West Irondequoit and reported that all parents interviewed wholeheartedly supported the program.

(c) In Hartford where the original selection was random it was also necessary to obtain parental permission. Ninety-six per cent of the parents of the children selected agreed to participate and presently there is an extensive waiting list.

(d) No program has reported any difficulty in obtaining youngsters to fill spaces available.

In other words, the basic response of the Negro parent has been favorable. Even among those youngsters who have been lost from the Hartford program for various reasons most of the parents would like to have them readmitted. This desire is found even in the face of feeling that the white school is prejudiced. This may be, as some claim, one more instance

BUSING STUDENTS FOR EQUAL OPPORTUNITIES

297

of the Negro's ingrained sense of inferiority and subservience — or it may be his assertion of his ability to prove himself even on white middle-class America's grounds.

The most striking data to support this latter hypothesis come from the bused children themselves. In a structured interview directed by a Negro *not* associated with the project, a random sample of 50 youth bused from Hartford expressed very directly their desire to continue to attend suburban schools. They expressed themselves in a manner which the interviewer saw as indicative of much greater self-esteem and self-confidence than was true of the inner city control child, were able to be more specific, felt strongly that they were receiving a better education (frequently referring to siblings or friends in the inner city schools as illustrative examples), and were aware of both subtle and direct prejudices against them.

What Will Happen to the Academic Standards of the White Schools?

In two of the four programs (Hartford and White Plains) this has been carefully surveyed by using each child as his own control and comparing children who have been in class with Negro youngsters with those who have not. In both studies the results underline the fact that there is *no* evidence of a drop in achievement among white youngsters when black children are placed in a previously all white class; in fact, what evidence exists suggests that the opposite may be true.

What Are the Attitudes of White Parents?

Again, Hartford and White Plains present direct evidence in this question based on an anonymous questionnaire. The rate of return was 31 per cent in White Plains

and 40 per cent in Hartford. The general design of the questionnaire was considerably different with the Hartford one requesting reaction to the program while the White Plains questionnaire directed attention to the impact of the program on that parent's child. Yet the results have interesting similarities: 50 per cent of the White Plains respondents saw the plan as positive while 54 per cent of the suburban Hartford respondents endorsed continuation without condition; 14 per cent of White Plains parents saw the program as negative while 15 per cent in the Hartford groups wanted it discontinued. Although there may be no clear mandate in these data, it appears that white parents with contact with the program tend to see it favorably.

How Will the Black Child Adjust Socially?

This is a complex question and the data reported here refers only to elementary grade children. Preliminary reports from White Plains indicate that Negro youngsters are making "satisfactory peer adjustments." In Hartford the following indices are available:

(a) Sixty-eight per cent of *Project* youngsters take part in after school activities in the suburb on a regular basis;

(b) On sociometric measures *Project* children are selected by suburban children in a proportion which is slightly greater than their numerical proportion in the room; (many of the choices were mutual choices);

(c) Suburban teachers report 70 per cent of the bused pupils as making a superior social adjustment and only 12 per cent of making a poor adjustment (on a three point scale).

What Is the Impact of Placement in a White or Racially Balanced School on the Academic Performance of Negro Youth?

Again, the differences in the characteristics of the pupils in the various programs pose real difficulty for comparisons. For example, the mean I.Q. of the Boston pupils on a group administered instrument is 102 while Hartford youth in an individually administered instrument where their reading disability would not penalize them had a mean I.Q. of 89. However, both groups are reported as considerably depressed on measures of achievement according to national norms. Still, a consistent pattern arises from the tentative results reported in these two projects (results are based upon one year of operation and must be viewed with caution until replicated in a second year). Both show project participants as reversing the trend toward greater deviation from national norms; in fact, they show growth rates in excess of normative expectations in both verbal and numerical achievement tests. In addition, Hartford youngsters show a growth of I.Q. which, though far from miraculous, is statistically significant (6.5 points).

Perhaps most important is the finding, again tentative, that the Hartford youth bused to suburbs show a growth pattern in achievement and mental ability that is clearly and significantly superior to their controls in the inner city *including those controls who are receiving intensive compensatory assistance*.

Can Busing Solve the Problem of Inequality of Educational Opportunity?

This question has geographic, economic and political aspects, but it does seem safe to state that there is no intrinsic reason for busing programs to operate at a

token level. Many communities (including the three involved in this paper) are ringed by essentially, all-white suburbs where there exists a large pool of potential classrooms for participation. For example, within the present busing radius of *Project Concern* there are over 2000 classrooms (K-6) exclusive of Hartford schools.

The economics of the program are somewhat demanding. The major expenses are the per pupil tuition charge which is paid to the suburban town and the cost of transportation (\$250-\$270 per child). At the same time these costs are not excessive when compared with the cost of educating the child in the inner city school with the additional expense of compensatory program. Also, the Commonwealth of Massachusetts under legislation passed in 1966 (Chapter 506) and the State of Connecticut under Public Act 611 have both given some state subsidizing as well as legal sanction to cooperative programs between communities designed to provide quality education for ghetto youth.

In other words, for most cities (and this obviously does *not* include cities like Washington, D. C., or New York) the problem which inhibits large-scale busing is not lack of suburban classrooms or lack of funds, but rather it is the political obstacle. The issue is not often "can it be done"; rather it is usually "do we really want to do it!"

SUMMARY AND CONCLUSIONS

Any inferences or conclusions must be made within the limitations of the available information, but at the same time the available information demands serious study. Perhaps the most striking element is the consistently favorable response from

BUSING STUDENTS FOR EQUAL OPPORTUNITIES

299

all who have been associated with these projects: educators, pupils, Negro parents, research personnel, and, to a large extent, white parents. Opposition tends to come from sources, varied as they be (from white conservative newspaper columnists to black militant leaders), who have had little, if any, direct contact with the programs. At the least, it can be said that busing has created a climate of hope for the families and has resulted in greater self-esteem for the pupils selected. In addition, the evidence of greater motivation for educational development can be interpreted from such items as attendance records, dropout rates, and teacher ratings. Under such circumstances the following conclusions appear justified:

(a) Busing is a logistically and economically feasible intervention for many cities.

(b) There is no evidence to support claims of psychological trauma among the participants nor is there evidence that they become alienated from their own community. In fact, the evidence available is in contradiction to both of these fears.

(c) There is no evidence that the quality of academic achievement among white pupils is depressed by placing educationally disadvantaged black children in their class. Again, the existing evidence points in the opposite direction.

(d) Black pupils bused into white elementary schools are quickly assimilated socially and appear to hold their own in the area of peer group relationships. This finding holds in spite of the fact that the children are alert to signs of prejudice among some students and staff members.

(e) Teachers in white schools experience no particular problem in coping with

the educational disadvantages of inner city nonwhites when these youngsters constitute less than 25 per cent of the classroom membership.

(f) Pupils transported to white schools show significant gains in achievement and mental ability scores when compared with their own prior performance (Boston and Hartford) or when compared with a comparable control group (Hartford).

(g) Again evidence is found which indicates the relatively slight impact of intensified services and programs when these are initiated in the ghetto school (Hartford); in fact, there appears to be no difference between these ghetto youngsters and those in the typical ghetto school situation.

(h) Observer ratings and film illustrate a consistent difference in the classroom climate and teacher-child interaction between inner city and suburban classrooms. It appears that this difference is not easily modified by introducing changes into the ghetto school.

(i) There are signs which suggest that the busing is a more effective intervention in the primary grades than is the case later on.

These conclusions, based as they are on interim materials, make a strong case for the effectiveness of busing as a means for moving toward equal educational opportunity. They raise serious questions about the concepts of the neighborhood school and homogeneous grouping, both of which appear to be bulwarks for the maintenance of the status quo. Yet these conclusions fail to convey the dramatic reality of the human experience which is expressed in a child's discovery that he is somebody because *he* can do things or

a parent's feeling that things can be better for her child. Put very simply it seems that the white school, with all its weaknesses, is more attuned to Yeats' words when he wrote:

But I, being poor, have only my
dreams;
I have spread them under your feet;
Tread softly because you tread on my
dreams.

*Ironies of School Desegregation**

Faustine C. Jones, *Department of Foundations of Education,
School of Education, Howard University*

PART I: HOW WE GOT HERE

Desegregation? It seems strange that the focus of this paper, in mid-1977, is concerned with the issue of public school desegregation. The fact that it is stands out in sharp contrast to the assurances and declarations of the nation—that all men are created equal, and that all citizens shall have equal protection of the laws. But here we are, with societal controversy still centered around the question of desegregation (including public school desegregation) twenty-three years after the *Brown* decision¹ mandated that imposed segregation be ended, and that equal educational opportunity be provided for Black youth.

What is desegregation? As a process, it is a reversal, or undoing, of segregation. The public policy of mandatory segregation had imposed on America the separation of the races (including separation in schools), and discriminatory practices against Blacks and other nonwhites had imposed on them grossly unequal conditions related to education, occupation, income, housing, and life chances. Thus, desegregation as public policy is designed to abolish forced racial segregation; end discriminatory practices related to education, occupation, income, housing, and life chances; and to remedy grossly unequal conditions. Desegregation is necessary, though not sufficient, to full and open access to all parts of the society, with the means to participate fully in that society.

With respect to schooling, it was expected that desegregation as policy and process would provide equal educational opportunity for Black youth. Equal educational opportunity is conceived as being a primary means of equipping the young with the mental and attitudinal tools, as well as the body of knowledge, necessary to later gain full access to all parts of the society, especially in occupation and income. In practice, it is ironic that school desegregation is, and has been, a “mixed blessing,” since it has both positive and negative overtones for Blacks and whites. As a result of these

*Editor's note: Due to the comprehensive nature of this article, it has been split into two parts.

¹*Brown v. Board of Education of Topeka*, 347 U.S. 483 (1954).

crosscurrents, the term “desegregation” has acquired an emotional loading which often colors and skews its real meaning in a negative direction for Blacks and whites alike. This emotionality must always be kept in mind in the discussion of school desegregation.

Roots of the Problem: 1619-1954²

The roots of the desegregation controversy lie deep in American history. Starting in 1619 and continuing into the nineteenth century, most Blacks were brought forcibly to these shores to be slaves in the plantation sector of the American economic and social system. Built into the maintenance of the slave system was the idea that Blacks were inferior as human beings; and, it is this continued idea of inferiority which is part of today’s desegregation controversies. In fact, once the idea of inferiority took hold, it perpetuated itself through a kind of self-fulfilling prophecy. Blacks were not included in the Constitution as full persons (3/5 Compromise), and their lowly status was made explicitly clear by the Dred Scott decision of 1857 which stated that Blacks had no rights which whites were bound to respect. Blacks were property, not people, under these circumstances.

Education was forbidden to slaves in the South, where nearly all the slaves and about half of the free Blacks in the country lived. The regulation of education for free Blacks in the South came from state laws and public administrative actions. These free Blacks did gain some education, primarily through apprenticeships, Sunday schools, and secret or private schools.

Free Blacks in the North sought education eagerly. They faced varying circumstances in different states, from relative equality in Massachusetts (outside Boston), to inhospitality in Connecticut, to exclusion from the public schools in Pennsylvania. Nowhere in the North was systematic, widespread, universal schooling available to Blacks, and discrimination dominated the kind of education available to Black youth.³

After the Civil War, 1865–1877, Blacks experienced a brief period when the Federal Government took a leadership role in formulating positive new policies. During this period, the Thirteenth, Fourteenth, and Fifteenth Amendments were added to the

²Portions of this background information have been excerpted from the author’s book, *The Changing Mood in America: Eroding Commitment?* (Washington, D.C.: Howard University Press, 1977), ch. 3.

³The most complete account of this pre-Civil War period is to be found in Carter G. Woodson, *The Education of the Negro Prior to 1861* (2nd ed.; New York: Arno Press and the New York Times, 1968). A very good abbreviated source is Chapter 1 of Meyer Weinberg, *A Chance to Learn: The History of Race and Education in the United States* (Cambridge: Cambridge University Press, 1977), pp. 11-39.

U.S. Constitution, freeing Blacks, granting them citizenship, and bestowing upon them the right to vote. The Freedmen's Bureau was established; it made meaningful differences in the lives of Blacks and poor whites, especially in providing educational opportunity. Blacks temporarily exercised their newly awarded civil rights, including the right to vote and some access to elected public offices. Federal efforts to help Blacks reached a zenith in the passage of the Civil Rights bill of 1875.

But only eight years later (1883), the Supreme Court declared this bill unconstitutional. The Court's decision let the nation know that the Federal Government would no longer insist upon equal rights for the Black population. In 1896, the *Plessy v. Ferguson* decision (163 U.S. 537) institutionalized the separate and unequal conditions which were to prevail as public policy (including public *educational* policy) until 1954. "Jim Crow" laws were passed by southern states to enforce a pattern of discrimination and segregation of Blacks. As a result, they were prevented from voting, holding office, and securing most remunerative work outside the Black community.

Equal educational opportunity was systematically denied Blacks. The effect of the Court's decision and the laws which followed it was to keep Blacks as a group in a servile state, a caste-like condition of societally imposed inferiority. But discrimination and segregation were not restricted to the South. Customs and practices in all areas of the country restricted Blacks to designated neighborhoods, particular kinds and levels of jobs, and specified schools. Sectional differences were differences in degree, not in kind.

The system of "compulsory ignorance"⁴ which had prevailed up to 1865 was replaced by a system of "separate and unequal" education which was to endure until 1954. Although *Plessy* mandated public policy of "separate but equal" the "equal" provision was conveniently and uniformly ignored by educational and public officials, with no sanctions or punitive measures forthcoming against them for so doing.

What were the characteristics of the "separate and unequal" educational pattern provided for Blacks in the South as long as the *Plessy* mandate of segregation prevailed? Shorter school terms were provided for Blacks than for whites, and in rural areas these

⁴Weinberg uses this term (*op. cit.*, p. 11) and traces its origin to James Simpson of the Society of Friends in England, who used it in 1865 after visiting Richmond, Va. Weinberg explains also that W.E.B. Du Bois also used this term about 1905, apparently independently of Simpson's usage (*op. cit.*, p. 368). Horace Mann Bond used the term in *The Education of the Negro in the American Social Order* (New York: Octagon Books, 1970).

were often split-term arrangements where children went to school only between planting and harvesting periods. School buildings were grossly unequal, with white schools ranging from adequate to luxurious in quality, while Black schools were merely adequate at best, more often quite shabby.

With respect to allocation of tax dollars, expenditures for Black schools were kept as low as possible, while all monies procurable were diverted to white schools. Black teachers and principals were paid lower salaries than white teachers with comparable experience until the early 1940s when some of those underpaid Blacks began to file and win equalization-of-salary suits against local school districts. Equipment for schools was sorely lacking, as were books and supplies. Transportation often was provided for white pupils, but not for Blacks. Poor pupil attendance was characteristic of rural areas; sickness was responsible for much of this absence. Deprivation accompanies segregation and second-class citizenship.⁵

It is clear, then, that inequality was created and perpetuated within the separatist concept which prevailed as public policy. However, that inequality was “justified” by powerful whites in high political positions as well as by influential white intellectuals of the period on the grounds that Blacks were inferior, and incapable of learning. The irony in all this is, as Weinberg points out, that “the claim of whites that Negroes were intellectually incapable of learning was refuted by the desperate attempt of whites to deny them schooling. Whites seemed to fear not that Negroes could not learn but that they would.”⁶

Another irony of the segregated southern system was that over time there developed, in spite of the system, a number of all-Black high schools in the 1920s, '30s, and '40s with reputations for academic excellence and outstanding graduates. Further, the segregated system guaranteed continuous, lifelong employment to a large number of Negro teachers and principals throughout the South.

In the North, there were cities which sought to provide equal separate systems for Blacks and whites—Gary and Indianapolis, Indiana; Dayton, Ohio; Chicago, Illinois. In mixed northern schools Black children often suffered from social isolation and from the lack of adequate and informed educational and vocational guidance.

At the level of higher education, private Black colleges began in

⁵For a fully documented account of these circumstances, see Bond, *op. cit.*

⁶Weinberg, *op. cit.*, p. 39.

the 1800s with the assistance of religious philanthropists, or under the auspices of the Freedmen's Bureau in the post-Civil War period. Most of these were in the South or in border states. Southern states provided public Black colleges after 1890, assisted by the second Morrill Act. In private and public black colleges, finances were limited. Since funds control the ability to employ faculty, the building and maintenance of structures, the quantity and quality of curricular offerings, etc., Black colleges were more limited than white colleges. However, these schools sought to maintain instruction at a standard level, and strict discipline among the student bodies.

Graduate and professional training were not provided in the Black colleges, although they were provided in white schools. Some southern states, such as Louisiana, Missouri, West Virginia, and Arkansas, paid tuition fees in northern institutions for Black graduate students who were barred by state laws from access to their own tax-supported state universities.

This obvious inequality at the level of higher education became the basis for the NAACP's concerted attack on segregation in education. The first suits were to remedy inequality, not to challenge segregation *per se* as unconstitutional.⁷ Finally the NAACP made its frontal attack on school segregation as an unconstitutional practice in the consolidated case, *Brown v. Board of Education of Topeka, Kansas*. The well-known decision of the Supreme Court in that 1954 case was that separate educational facilities are inherently unequal. *Brown II*⁸ (1955) mandated that desegregation be accomplished "with all deliberate speed." *Brown I* and *II* are the landmark decisions from which developments in the law of school desegregation have flowed since 1955.⁹

The Past: 1955-1969

Blacks were pleased at the change of concept, even though they knew there never had been any systematic attempt to make their education "separate but equal." They were hopeful about the possibilities expressed by the *Brown* decision but also very reality oriented, based on a long history of negative experiences, realizing that *Brown* did not signal the end of the struggle for equality, justice, and liberty for Blacks in America. W. E. B. Du Bois put it this way:

⁷*University of Maryland v. Murray*, 169 Md. 478 (1936); *Missouri, Gaines v. Canada, Registrar of the University of Missouri*, 305 U.S. 337 (1938); *McLaurin v. Oklahoma State Regents for Higher Education*, 339 U.S. 637 (1950); *Sweatt v. Painter*, 339 U.S. 629 (1950).

⁸*Brown v. Board of Education of Topeka*, 349 U.S. 294, at 300 (1955).

⁹The full story of events leading up to *Brown* and of the people involved in the case is beautifully told by Richard Kluger in *Simple Justice* (New York: Alfred Knopf, 1976).

... Unfortunately in the United States there is a long habit of ignoring and breaking the law.

.....
During the 25 or 50 years while the southern South refuses to obey the law, what will happen to Negro children? Widespread effort for their protection and education should be undertaken by the Negroes themselves in inner co-operative effort. We must not make the error of the German Jews. They assumed that if the German nation received some of them as intellectual and social equals, the whole group would be safer. It only took a psychopathic criminal like Hitler to show them their tragic mistake. American Negroes may yet face similar tragedy. They should prepare for such eventuality.¹⁰

His words were prophetic, for the response to *Brown* from southern governors and state legislatures was "massive resistance." Clearly remembered is Governor George Wallace, who stood in the "schoolhouse door" at the University of Alabama to prevent Vivian Malone and James Hood from entering. An equally dramatic event occurred in Little Rock, Arkansas, when Governor Orval Faubus sought to stop nine Black youths from entering Central High School, causing President Eisenhower to abandon his "hands-off" stance and send Federal troops to that city in 1957. In some cities such as Orangeburg, South Carolina, and Yazoo City, Mississippi, Black parents who petitioned school boards to desegregate schools had their petitions rejected, and were subjected to such severe economic pressures as job loss and denial of credit. In 1959, Prince Edward County, Virginia, closed its public schools to avoid desegregating them.¹¹

The question of public school desegregation stayed in the courts; enforcement of the *Brown* decision was by default left to them since neither Congress nor the President helped implement it during Eisenhower's administration. In fact, in the Congress southern senators and representatives with their accumulated seniority blocked all efforts at assistance. Thus, progress toward school desegregation was extremely slow; there was only three per cent desegregation during the decade ending in 1964.¹²

Southern state legislatures proceeded to enact new laws to thwart desegregation. These included repeal or amendment of compulsory school attendance laws, financial assistance to white-segregated academies, and permission to close or cut off state aid to court-ordered desegregated schools. The NAACP was outlawed

¹¹For the complete story of this action and its aftermath, see Bob Smith, *They Closed Their Schools: Prince Edward County, Va. 1951-1964* (Chapel Hill, N.C.: University of North Carolina Press, 1965).

¹²*Understanding School Desegregation* (Washington, D.C.: U.S. Commission on Civil Rights, 1971), p. 7.

in some southern states. But the pupil placement laws were the most effective legislation passed in the 1954–64 decade. These laws made it necessary for Blacks to bring individual suits in each school district so that no single decision ordering desegregation could be used against the entire state school system.¹³ Very few Black children succeeded in hurdling the obstacle course of application forms, tests, and appeals in order to be assigned to a school other than their traditional one. Coupled with economic and social sanctions against Black adults, pupil placement laws and freedom of choice attendance plans resulted in only token desegregation of students from 1954 to 1964.

In a number of southern states, building programs for Black schools were instituted quickly after *Brown II*. School officials and politicians seemed to feel that if Blacks had their own new buildings, they would not press for admission to white schools. This extensive building program from 1955–64 explains why James S. Coleman failed to find the substantial differences he expected to see between black and white school structures when he embarked on his now-famous 1966 study, *Equality of Educational Opportunity*.¹⁴

The irony of these evasive tactics is that these were the same “law-abiding” public and school officials who had so closely adhered to the separate mandate of *Plessy* when it was the law of the land. That decision *protected* their vested interests. But they suddenly changed their “law-abiding” posture when *Brown* became the law of the land because it *threatened* their vested interests, and those of their peers. Yet these same officials would be the first to argue that Americans cannot be permitted to obey only those laws which suit their individual purposes, not acknowledging the contradiction between this expressed belief and their daily behaviors. No doubt many of them voted for Richard M. Nixon in 1968 as he campaigned on a platform of “law and order,” again without the acknowledgement that their own behaviors had not been lawful or orderly in seeking means of evading *Brown*, the law of the land. It is ironic that Nixon and his vice-president, Spiro Agnew, after campaigning so vigorously for “law and order,” violated the concept so thoroughly, with both leaving their high offices in public disgrace.

Looking at the schools themselves, from 1954–64 southern educators in desegregated schools resorted to, or expanded, homogeneous ability grouping and track systems to classify students.

¹³Weinberg, *op. cit.*, pp. 92–95.

¹⁴James S. Coleman, *Equality of Educational Opportunity* (Washington, D.C.: National Center for Educational Statistics, U.S. Government Printing Office, 1966).

The general pattern which emerged was that the college preparatory track was almost all white, while the basic track was almost all black. There was almost no possibility of reclassification once a student had been placed in the track deemed appropriate for him. School officials said this grouping pattern was the best mechanism to cope with unequal achievement on the part of black and white students. The practical effect of the track system was segregation of students in individual classes within a building ostensibly desegregated because of the physical presence of youth of both races in it.

With the change in national leadership from Eisenhower to Kennedy to L. B. Johnson, and with organized, overt self-help protest efforts of Blacks and their allies, the Civil Rights Act was passed in 1964. Title VI of that Act provided that school districts which refused to desegregate were subject to a cutoff of Federal education monies as well as subject to additional judicial decrees. "Money" was the magic word; progress in school desegregation accelerated because of the threat of the denial of funds. There was 30–40 per cent desegregation from 1964–69, a tenfold increase in five years over what *Brown* alone had produced in ten.¹⁵

The Civil Rights Act of 1964 brought about an expansion of the U.S. Department of Health, Education and Welfare (HEW). From 1964–69, HEW and the Justice Department were responsible for school desegregation efforts. This meant an expansion of the role of the Federal Government in education, constitutionally the province of state and local governments. This expansion was strongly contested by powerful southern senators and congressmen, and HEW found itself subjected to political attacks. Desegregation was a primary issue in the 1968 presidential election, and when Nixon became president in 1969 he reversed the trend toward strict enforcement of HEW's guidelines.

Federal desegregation efforts focused on the South during this period. Many Americans also felt, really, that segregation was primarily a southern problem. So from 1955–1969 untouched school segregation problems grew in the North and West. Black citizen protests and boycotts against school segregation began in the North—New York City (1954–55), Chicago (1960), Boston (1962), Cleveland, Ohio, Gary, Indiana and Chester, Pa. (1964). Despite these and other efforts to attack the problem in the North, the isolation of Black from white children continued in schools. *De facto*

¹⁵For a full account of the *Civil Rights Act* of 1964 and its effects on school desegregation, see Weinberg, *op. cit.*, pp. 120–126; *Understanding School Desegregation*, *op. cit.*, p. 7; *The Desegregation Literature: A Critical Appraisal* (Washington, D.C.: National Institute of Education, 1976), pp. 10–11, 16–18.

versus *de jure* distinctions were heard more often. In this period northern and western school systems did not receive the full impact of Brown or post-Brown decisions.

How did the pace of desegregation, and the quantity/quality of desegregation efforts affect large numbers of citizens? Opposition to pro-desegregation Court decisions was expressed openly by some white groups. A particularly graphic expression of this opposition appeared in the form of billboard advertisements across the nation urging the people to “impeach Earl Warren,” who, as chief justice, was helmsman of the Court. There was a rapid increase in the number of white private schools, especially in the South; white parents took their offsprings out of the public schools.¹⁶ In most major cities, Washington, D.C. being a prime example, white flight to the suburbs escalated.¹⁷ The practical effect of this exodus was to resegregate the public schools of the cities thus vacated. In other communities local resistance to desegregation resulted in demonstrations and violent acts against desegregators and potential desegregators. White intellectual efforts to study, analyze and define the problem resulted in James S. Coleman’s massive 1966 report, *Equality of Educational Opportunity*, hailed as a landmark effort to document the lack of equal educational opportunity. On the other side of the coin, genetic intellectual inferiority doctrines were revived by Shuey¹⁸ in *The Testing of Negro Intelligence* (1966), and by Jensen,¹⁹ in the winter 1969 issue of the *Harvard Educational Review*. The literature on deprivation, cultural and social, escalated. *Racial Isolation in the Public Schools*,²⁰ a second massive report, focused on illegal segregation.

National polls and surveys indicated a massive shift in the racial attitudes of white Americans since World War II. There had been a movement away from the traditional belief in white superiority and its concomitant patterns of segregation and discrimination toward a more equalitarian view of the races and race-associated relationships, such as those in work situations. Persistence forecasting predicted that this trend would continue, but crosscurrents existed which created uncertainty for the future. Further,

whites wanted change to occur gradually and were repelled by violent aspects of Black rhetoric and action.²¹ The Kerner Commission's *Report* in 1968²² was far more bleak, saying that the nation was divided and moving toward two societies, separate and unequal. The *Report* identified white racism as the root cause of civil disorders in the '60s.

But what of the Black population? Blacks entered this period with a hopeful optimism that ideals of equality and justice could soon be reached. They felt that whites would change and begin treating Blacks better. But, by 1963, a massive *Newsweek* poll conducted by Louis Harris revealed that Blacks were losing patience with gradualism. Subsequent polls in 1965 and in 1969 confirmed this trend.

In education, Blacks began to press for community control of schools because they had become very frustrated with the slow pace of desegregation and with the declining quality of educational achievement of their offspring. The heated controversy around I.S. 201 in New York was probably the most publicized of the efforts of Blacks to gain community control of the schools attended by their children.²³ In other communities, such as Gary, Indiana, massive boycotts were directed against school boards making educational plans perceived to be inimical to Black people—such decisions as vague integration plans, busing the most intelligent Black children to white schools, questionable assignment of principals and teachers, gerrymandered school district boundary lines, etc. Many Blacks came to the conclusion that school systems were fundamentally racist, and therefore determined to protect the status quo.

In the South, large numbers of Black teachers lost their jobs, especially in small towns and rural areas where the probability was great that they would teach white children. In 1965, Samuel B. Ethridge, spokesman for the National Education Association (NEA), pointed out that 5,000 Black teachers would be displaced in 17 southern states as a result of school desegregation, and the nation was shocked. But in a press release issued May 19, 1972, by NEA, Ethridge and Donald R. Shire reported that discrimination had resulted in a projected loss of 31,584 Black teachers in the South between 1954 and 1970, and might be costing black educa-

tors a quarter of a billion dollars annually.²⁴ Actually dismissed were 6,000 Black teachers; the additional 25,584 displacement came from failure to hire, or a slowdown in hiring Black teachers.

Ethridge said many districts no longer employ Black teachers; in one state 25 counties that hired one or more Black teachers in 1954 had none in 1970. Black principals fared worse than did teachers; they were discharged or demoted to the point where in the fall of 1970 *The New Republic* carried an article describing the situation in its title as "The Black Principal: Another Vanishing American."²⁵ As schools were desegregated, Black principals were eliminated. The effect of this policy affected not only these individuals and their families, but removed a valuable image for Black youth and a valuable knowledge resource from the community. The article concluded, "...the deliberate destruction of this valuable resource is one of the tragedies of our time."

Black students suffered, as well. Early in May, 1972 the NEA reported,

...thousands of black students were being pushed out of school, suspended, harassed, arrested, and in a few instances, killed or maimed. Fragmented data from 238 districts in 11 Southern states (only 10 per cent of the region's districts) indicate that 19,441 students have been involved in school walkouts, 11,146 have been suspended and sometimes expelled, and over 2,000 arrested.²⁶

In addition, the Southern Regional Council reported in November 1973 that Black students had been excluded from extracurricular activities, tracked into segregated classes, and confronted with condescension or hostility.²⁷

What were the schools as educational institutions doing in this period to facilitate desegregation? In the early sixties open enrollment and freedom of choice were methods of desegregation. However, the courts did not judge the results of these methods to be sufficient. There is general agreement in the literature, and the U.S. Commission on Civil Rights is particularly clear in this matter, that open enrollment and freedom of choice plans do not work. Rezoning via pairing (the Princeton Plan) was tried in some cities, using elementary school children. "Central schools" were established in Teaneck, New Jersey.²⁸ "Educational parks" were recommended for the secondary level; most of these failed to materialize. "Mag-

²⁶Quoted in Weinberg (ed.), *Integrated Education*, op. cit.

²⁷*Ibid.*

²⁸Teaneck's story is told in Reginald G. Damerell, *Triumph in a White Suburb* (New York: William Morrow and Company, Inc., 1968).

net schools'' were proposed also, and some were implemented.

But where residential segregation was extreme, as in large cities, none of the above methods would provide school desegregation of any moment. Thus busing has been used as a method to transport children to schools outside of their neighborhoods in order to achieve desegregation. Busing is, without a doubt, the most controversial of the methods cited above, and it has become an emotional and political symbol/issue for political leaders, school leaders, Blacks and whites.

A final method which has been recommended, but rarely implemented, is multi-district desegregation—desegregation across school district lines of discrete cities and suburbs in metropolitan areas. Citizen support for multi-district desegregation is weak.

What was the situation at the end of this period? Weinberg sums it up this way:

....In 1968, two-thirds of black children in eleven southern states were in all-black schools; in 1970 about one-sixth; and in 1971–72, about one eleventh. A far smaller proportion of children attended segregated schools in the South than had done so in 1954. On the other hand, in the years after 1960, segregation rose to new heights in most northern cities. In those northern cities that were ordered to desegregate, however, segregation rates fell very sharply.²⁹

PART II: WHAT NOW?

The Decade of the Seventies

Most of the decade (1970–January 1977), came under the political leadership of Nixon and Ford, both of whom did not assume positive leadership roles or seek to inspire the American people to live up to the best in themselves or their ideals. Instead, these men assumed a public posture of playing to the fears and negative mind-sets of many Americans. These presidents and the Congress succeeded in limiting the roles of the Justice Department and of HEW in enforcing civil rights. In fact, it was in 1969 and 1970 that the Justice Department's resources were, for the first time, placed at the disposal of anti-desegregation forces, as its lawyers requested a delay of the Supreme Court's desegregation order in *Alexander v. Holmes*.³⁰ Verbal pronouncements against "forced busing," coupled with other negative attitudes and behaviors on the part of national leaders, have meant that the momentum for school desegregation has been greatly slowed in the 1970s.

This negative posture has been aided, abetted, and reinforced by a rapidly growing body of social science literature on Blacks

²⁹Weinberg, *A Chance to Learn* . . . , *op. cit.*, p. 137.

³⁰*Alexander v. Holmes County Board of Education*, 396 U.S. 19 (1969).

and other minorities. Much of this research, writing, and interpretation is being done by influential white intellectuals who have assumed the role of “philosophical ideologues of the second post-reconstruction.”³¹ Social science research has proliferated also in assessing causes of inequality and poor academic achievement, evaluating educational programs, and assessing effects on children, Black and white. Federal monies have supported much of this desegregation research, most of which is done by prestigious white scholars in prominent institutions, not by Black scholars.

From the accumulated research, the emerging view is extremely negative for Blacks. Much of it holds that schooling makes little or no difference in the lives of individuals and minority groups, or that the rate of return from long years of formal study is increasingly low and therefore, especially in higher education, not worth the price. Failures of schools are attributed to deficiencies in Black children, their families, and/or their low socio-economic status.

There is an assault on policies and programs, including those in education, that are designed to help Blacks, other minorities, and the poor. The assault can also be seen as an attack on the concepts of equality and justice. The influence of prominent white social scientists, and their attacks as cited above, are perceived negatively by Blacks and interpreted as part of an eroding commitment by the dominant society, its policy makers, and its influential white intellectuals. Much of the elitist social science literature since 1966 has been undercutting the major means by which Blacks, other minorities, and women have sought to gain equality and justice in America. Thus this literature, in a period of increasing conservatism, has assisted in skewing public policy in a negative direction, into a downward spiral. In fact, in many quarters today formal public-supported schooling is itself under siege.

It is ironic that many of these prestigious intellectuals are former liberals who assisted Presidents Kennedy and Johnson in formulating egalitarian social and educational legislation and programs in the 1960s. Those social/educational programs did not, and could not, show massive positive results immediately—given the long history of negative laws/policies/programs which had to be overcome. It seems that when these intellectuals lost their mentors and witnessed the complexity and difficulty of resolving long-standing domestic social/educational problems, while encountering the rigidities of entrenched bureaucracies most interested in main-

³¹This description is credited to Professor Arthur Miller of George Washington University Law School in Washington, D.C. The term means that these men are the architects of a design to return public policies and the national mood to the *status quo ante* period, reversing the positive policies and national mood which prevailed *circa* 1961–1966.

taining themselves, they lost the nerve, interest, and willingness to continue their efforts to effect social, political, and educational change.

Further, they had come under attack by George Wallace and Spiro Agnew, as well as other public officials, for their efforts. Under attack, and finding no easy answers to complex racial, social, and educational problems these prestigious intellectuals retreated. They felt threatened also by affirmative action legislation and programs designed to assist Blacks, women, and other groups which still have attained less than parity with white males. Now they speak and write in a neoconservative vein, compared with the former liberal style. They have retreated into secure positions and are now concerned with the maintenance and stability of an order which has rewarded them.

In this decade, most of the post-Brown legal decisions have remained in the spirit of *Brown*. In the South, *Swann v. Charlotte-Mecklenburg County Board of Education* (1971) is very important. Since the school system in Charlotte-Mecklenburg, N.C. is a city/county *consolidated* system, the Court ruled that in order to desegregate it, students could be bused from the city into the county schools, and vice-versa. Thus the Court approved busing as “a normal and accepted tool of educational policy,” with qualifications of recognition of the health of the children, possible impingement on the educational process, and the age of the students.³² This *Swann* decision had been preceded by *Alexander v. Holmes County Board of Education* (1969), a Mississippi case in which the Court’s ruling was that “the obligation of every school district is to terminate dual school systems at once and to operate now and hereafter only unitary schools.”³³ HEW remained inactive in enforcing these decrees, despite the mandate provided.³⁴

Turning to the North, in the decade of the seventies two post-Brown cases stand out. The first is *Keyes v. School District No. 1* in Denver (1973). The documentation of intentional actions by the Denver school board which had culminated in segregation resulted in a Court decision that the effect of those actions was a dual segregated school system. Thus the Court ruled that district-wide remedies were appropriate because segregation in one part of the district had a direct relationship to other parts of the district.

In the second case, *Milliken v. Bradley* (1974), metropolitan

³²*Twenty Years After Brown: Equality of Educational Opportunity*, a report of the U.S. Commission on Civil Rights (Washington, D.C.: U.S. Government Printing Office, March, 1975), pp. 23-27.

³³*Ibid.*, p. 20.

³⁴*Ibid.*, pp. 26-28

area desegregation was addressed (Detroit and its adjacent suburbs). Here the Supreme Court honored city/suburban dividing lines for their separate school districts, and refused to demand an interdistrict remedy for segregated schools. Many consider the Milliken case a setback in efforts to desegregate separate school districts in nonconsolidated metropolitan areas, North and South. Although the Court reaffirmed in principle the constitutional standards since *Brown*, it placed more stringent requirements on evidence needed to substantiate arguments for urban desegregation methods. "The Court indicated that the remedy must be appropriate to the violation and that evidence of discrimination must be clear for all districts affected."³⁵

That thinking was extended by the Court on June 27, 1977 when it ruled 8–0 in the Dayton (Ohio) case that "judges in school desegregation cases must tailor remedies to fit the constitutional violations."³⁶ In the Court's opinion, Justice William H. Rehnquist said:

Mandatory segregation by law of the races in the schools has long since ceased. . . The duty of federal trial and appellate judges in such cases is to determine if a school board intended to or did discriminate against minority pupils, teachers or staff. . . Then, they should measure the "incremental segregation effect" the violations had on the racial distribution of the school population against what that distribution would have been had there been no violations. . . . The remedy must be designed to redress that difference and only if there has been a systemwide impact may there be a systemwide remedy.³⁷

The Dayton case is interesting because the city is a northern one where state law did not mandate a dual school system. Yet actions of the Board of Education there resulted in segregated schools. But the Supreme Court overruled the desegregation plan previously approved by the Sixth U.S. Circuit Court of Appeals, stating that it was true that the school had committed constitutional violations, but that these did not "suffice to justify the remedy imposed."

Thus the Dayton case seems to follow the pattern being established by the Burger Court in the area of civil rights—the application of strict procedural limits to rights implicitly endorsed in earlier decisions. The Burger Court's "judicial restraint" in civil rights decisions is characterized by a reaffirmation of the traditional values and principles in the law, and a disinclination to expand the

³⁵*Ibid.*, p. 41

³⁷*Ibid.*

law in civil and individual rights, criminal procedures or education.

It remains to be seen exactly what the Carter administration's educational policies, including those on school desegregation, will be. Two positive efforts with respect to school desegregation have been exerted. The first occurred in April, 1977 when the Dayton case was under review by the Supreme Court. The Carter administration, via Attorney General Griffin B. Bell and several of his top aides, submitted a "friend-of-the-court" brief which supported the desegregation order of the Sixth U.S. Circuit Court of Appeals. This order had approved a desegregation plan which would have required busing of some 15,000 students, along with other desegregation techniques. It appeared that the support of the Justice Department for the concept of desegregation was designed to head off a major retreat from school desegregation on the part of northern school officials and the highest Court. Although the June decision negated these April efforts on the part of the Carter administration, the efforts were supportive of desegregation.

Secondly, the Carter administration has advocated school pairing and clustering plans involving busing as a mechanism of school desegregation. However, on June 28, 1977, the Senate voted 51–42 to "block the Department of Health, Education, and Welfare from forcing school systems to bus students for desegregation purposes, including 'pairing' and 'clustering' plans."³⁸

With respect to Congress, busing controversies continue within its halls, and emotionality regarding the issue grows. What is important to note is the support of antibusing legislation in Congress. Some senators who previously voted against anti-busing legislation now vote for it. The HEW funding bill has, since 1975, carried an anti-busing rider sponsored by Senator Robert Byrd (D., W.Va.). This rider bars HEW from forcing the busing of pupils beyond the school nearest their homes for desegregation purposes.³⁹ The House joined the Senate in banning pairing plans when they involve busing. Blacks were surprised to find that Senator Thomas Eagleton (D., Mo.) opposed the pairing plan, arguing that it would contribute to further white flight from predominantly Black areas.

During the summer of 1977 when the Labor-Health, Education and Welfare appropriations bill was under consideration and debate in the Congress, Senator Eagleton "sponsored an administration-backed amendment to cut \$615 million from Title I educa-

³⁸*The Washington Post*, June 29, 1977, pp. A1, A8.

³⁹*Ibid.*

tional funds for communities with low income children.”⁴⁰ Opposition to his amendment came from Senators Edward Brooke (R., Mass.) and Jacob Javits (R., N.Y.). Senator Warren Magnuson (D., Wash.) proposed a compromise cut to \$100 million; his compromise lost. Brooke and Eagleton suggested a \$65 million dollar cut which was accepted. Fund-cutting efforts often greatly reduce programs designed to help those groups and individuals who still have less than parity with the majority group.

Current behaviors of congressmen suggest that in the future stronger anti-busing legislation may be forthcoming, and/or a constitutional amendment against busing may be proposed. With attachments to HEW funding bills to restrict busing, and with the new guidelines of the Dayton decision,⁴¹ the pace of busing to achieve desegregation is likely to slow perceptibly in the future. Congress and the Supreme Court seem to be reinforcing each other in busing/desegregation matters in a conservative direction.

In higher education today, two issues related to desegregation are paramount. One is the whole question of affirmative action policies, procedures, guidelines, and enforcement. The other comes from the Adams rulings aimed at ending dual state college systems established during the era of legal segregation.

With respect to affirmative action, HEW won an important victory when on June 28, 1977, the Senate refused, 64-31, to strip the department of its enforcement power to enforce “affirmative action hiring and admissions policies at institutions getting government financial aid.”⁴² The move against affirmative action had been sponsored by S. I. Hayakawa (R., Calif.) and Jesse Helms (R., N.C.). While affirmative action policies and programs are usually thought of as directly related to equality of opportunity, their practical effect also is to desegregate.

Affirmative action is one of the hottest societal issues today. Most Blacks want the concept retained, with operative policies and programs for at least one educational generation. Many white males, including very prominent intellectuals, want the concept, policies and programs eliminated. They regard the long history of black/female/minority exclusion as irrelevant.

With respect to the Adams rulings, aimed at ending segregated state college systems, most Blacks fear that desegregation of the state college systems affected by the Adams cases will wipe out

⁴⁰*Ibid.*

⁴¹In brief form these are: (1) determining the incremental segregative effort of constitutional violations on the distribution of students, (2) comparing that distribution with what it would have been without violations, (3) redressing that difference, and (4) providing a system-wide remedy only if there has been a system-wide impact.

⁴²*The Washington Post*, June 29, 1977, p. A1.

historically Black public colleges. Yet, there are no guarantees that numbers of Blacks will in the future be able to enter and graduate from predominantly white colleges, universities, and graduate schools. In fact, the opposite is predictable from current decisions being made.

But what of desegregation practices in school systems at the present time? Is desegregation working? In *Fulfilling the Letter and Spirit of the Law: Desegregation of the Nation's Public Schools*, the U.S. Civil Rights Commission said, in August, 1976, that desegregation is working in most communities although the problem remains, especially in large cities. It called constructive local leadership the most important ingredient in determining the success of desegregation efforts. Those local leaders are

... dependent on the tone set by leaders at the national level. This tone is determined not only by the statements officials make about the desirability of desegregation, but also by the support they give, or fail to give, to court decisions designed to implement the constitutional rights of children and young people.⁴³

Chicago is an interesting representative of still-segregated cities. The long-time mayor, Richard J. Daley, and his appointed Board of Education, engaged for more than a decade in successfully delaying school integration. When Federal pressures to desegregate were exerted, via withholding of funds in the 1960s, Mayor Daley was said to have used his personal power in Washington, D.C. to remove that pressure. Whether that is true or false we are not sure, but it is a fact that the funds were restored to Chicago's schools, without desegregation of students or teachers occurring. Racial hostilities are prevalent in Chicago, and the city is thought to be leaderless in the integration effort. Local religious leaders and the local news media have failed to promote racial understanding. Ethnic enclaves endure, and these groups exhibit fierce ethnic pride. It is felt by most people that peaceful desegregation will be difficult in Chicago, where the public schools are about 59 per cent Black, 25 per cent white, and 16 per cent Hispanic.

The nation's capital, Washington, D.C., may well lay claim to the most segregated urban school system in the nation. It is about 97 per cent Black, with no immediate possibility of desegregating across Maryland or Virginia state lines. Additionally, private schools in the area are growing and prospering with enrollment of middle-class white and Black students.

In the seventies some school systems have demonstrated increased willingness to comply with the law (desegregation rulings).

⁴³*Fulfilling the Letter and Spirit of the Law: Desegregation of the Nation's Public Schools*, a report of the U.S. Commission on Civil Rights (Washington, D.C., August, 1976), p. 300.

The school boards and superintendents of these systems made a decision to live up to their legal and moral responsibilities, and to plan for their school systems accordingly. The Montgomery County, Maryland, public school system is one such example where educational planning for desegregation began voluntarily, without coercion from the Federal Government. School officials, cooperatively with parent/citizen advisory groups, took the initiative in planning for the desegregation of some lower county schools where racial and ethnic group minority children were enrolled in growing numbers and proportions. It was ironic that a small group of citizens tried to use this voluntary aspect of planning *against* school officials by saying that Montgomery County ought to wait until it was under a Federal court order to desegregate. This group's will did not prevail among fellow citizens or in the courts; it was overruled in both arenas.

Montgomery County developed magnet schools, pairing plans, and clusters. Some pupil transfers were mandatory, but others were voluntary. Only 21 transfer requests of a total of 222 were refused, because they would have increased racial imbalance.⁴⁴

What benefits have resulted for students from school desegregation? Opinions are mixed. The Civil Rights Commission reported that "school districts which have experienced desegregation for several years generally report that minority student achievement rises and that these students often exhibit greater motivation that ultimately leads to pursuit of higher education. Majority group students hold their own academically and they commonly report that experiences with minority students have dispelled long-held stereotypes."⁴⁵

Nancy H. St. John focused on the consequences of school desegregation for children. She points out that twenty years of study of the effect of school racial composition on children has netted inconclusive results, and explains:

... I have come slowly to the conclusion that the overall inconclusiveness of the findings is due not so much to these limitations as to the fallacious assumption that desegregation is a unitary phenomenon, that racial balance is *the* important variable, and that how it is implemented is of secondary importance.

... School desegregation is a many-sided phenomenon, whose effects may be simultaneously beneficial to children in some respects and detrimental in other respects. Whether the potential benefit outweighs the potential harm depends not only on characteristics of individual pupils involved but above all on how well schools adapt to meet the challenge of a biracial population.

⁴⁴"Learning: Annual Report and School Community Newsletter," Montgomery County Public Schools, June/July, 1977, p. 3.

⁴⁵*Fulfilling the Letter and Spirit of the Law* . . . , *op. cit.*, p. 294.

For too long courts, legislatures, schoolmen, and social scientists have been obsessed with questions of quantity quotas, and balance, rather than with the educational process itself. The real task—to translate desegregation into integration—still remains.⁴⁶

The fact that this task still remains, years after *Brown*, has alienated many Black parents and citizens. As a result of that alienation they have turned toward seeking community control of the schools⁴ in which their children are enrolled, or larger numbers of Black teachers, principals, and/or higher-level administrators in desegregating systems. They have turned to street academies, schools without walls, the use of adult night schools, and/or the G.E.D. test in efforts to find suitable educative arrangements.

Still other Black adults have turned toward the past, reexamining in retrospect selected segregated Black high schools' successful educational practices. They are trying to ascertain what conditions, attitudes and behaviors existed in segregated Black high schools in the 1920s, '30s, and '40s to contribute to the excellence of many of the graduates. Dunbar High School in Washington, D.C. was one such segregated public high school which graduated far more people who became highly successful adults than could have been expected by chance, particularly in view of the inequalities imposed by the segregated system. There is no unanimity today in the Black population regarding the question of public school desegregation, beyond the most basic consensus that forced segregation must not be reimposed. Most parents simply want their children to be well-educated wherever they are.

As far as the general public is concerned, opinion polls show that most Americans support the concept of desegregation, at least in the abstract. An atmosphere of tolerance has, in most communities, replaced the atmosphere of hostility and violence. In a few schools, principals say "Our kids have actually started to understand and relate to each other on the human level—instead of on the color level."⁴⁷ This is positive as far as it goes. However, white flight from desegregating cities and close-in suburbs continues. The fight against busing as a mechanism for desegregation has become ever more heated. There is continued resistance to the employment of Black teachers, principals, and high-level school administrators—except in token numbers. The feeling still seems to remain that educated Blacks are "different" from the majority of Blacks, but still qualitatively beneath their white counterparts in ability to perform professionally.

⁴⁶Nancy H. St. John, *School Desegregation: Outcomes for Children* (New York: John Wiley & Sons, 1975), p. 88.

⁴⁷*The Washington Star*, August 2, 1977, A1, D12. The *Star* ran a series of four articles on desegregation July 31–August 3, 1977. It was authored by Lorenzo Middleton, a staff writer.

With respect to educational policy, the general public is asking the question, "Should the courts be shaping educational policies and practices by virtue of their decisions?" This suggests that the courts are not the appropriate societal agent or institution to be making policy decisions, and that the decisions being made are undesirable. Yet neither the executive nor legislative branches of government at the Federal level, nor any state, has taken a leadership role in education which could be depended upon to promote equal educational opportunity for minorities or the poor. It is easy to criticize the judicial branch for what it has done, but where is the criticism of the other branches, and of states and cities, for what they have not done in the way of enhancing equality in education? Where is the criticism of the educational establishment *itself* for what it has *not* done in this respect?

FUTURE PERSPECTIVES ON DESEGREGATION

It is ironic that society placed the major burden for desegregation on its public schools. Schools are not America's most powerful institutions, so to put them in the position of pace-setters in this controversial matter and to give them no sustained, consistent moral, financial, and psychological support to achieve the goal was to build in tension, conflict, and some failure. Had America's major institutions—big business, the government at all levels, and the military—supported the concept of desegregation in all sectors, the obstacles and tasks faced by the school in this respect would have been minimized. For although the *Brown* case challenged unequal school policies and practices, it was and is very clear that educational inequities are part and parcel of a general system of inequities imposed on Blacks through public policies supported by the private sector.

It is clear that when presidents take a strong positive leadership stance working for social reform, they provide an image and set a tone for moving America toward its expressed ideals. Thus if the incumbent president, Jimmy Carter, can be influenced now to follow the vigorous tradition of Kennedy and Johnson, his actions will be good for future desegregation efforts. It is in the public interest that he pursue America's highest ideals through concrete policies and programs, and not simply give lip service to those standards. His current caution is disappointing and potentially estranging, as Vernon Jordan pointed out in his speech at the Urban League's national convention in Washington, D.C. in July, 1977.

Citizens must not accept conciliatory words in lieu of forward-looking domestic programs. History reminds us that Woodrow

Wilson accepted an overwhelming Black vote in his behalf, and proceeded to support policies and programs which were grossly inimical to the welfare of Blacks. We must not allow history to repeat itself in this respect.

The current tendency of Congress and the Supreme Court to reinforce each other in conservative ways must be broken in the near future. Blacks and their allies must maintain eternal vigilance over their representatives' voting patterns. It will take sustained political efforts of coalitions across racial/ethnic lines to change legislative behaviors, but it can be done.

If and when vacancies occur on the Supreme Court, it is incumbent upon President Carter to recommend the kinds of people who have the strength to create new standards of honor and morality with respect to race/ethnic/male-female relations and advancing equality of opportunity. What is important here is that when any two branches of the Federal Government reinforce each other positively, desirable social change occurs. When they reinforce each other negatively, the reverse occurs. Therefore, Blacks and other concerned people must work eternally against retrogression. There can be no rest for the weary in the future, or what small gains have occurred toward equality will be lost.

Black elected officials at state and local levels must form coalitions with other concerned people to activate the passage and enforcement of laws to assist those individuals and groups which have not yet attained parity with the majority. While the numbers and proportions of these officials still are small, there are more of them than ever before, and groups must use what they have, not what they wish they had in numbers. Since public education is primarily and fundamentally a state and local affair, more challenges to inequality must in the future occur at the state and local levels.

Blacks and other concerned people must re-learn the lessons of history. It is through organized efforts via legitimate, organized groups that most social gains occur. Social change has to be forced upon grass-roots American public opinion; almost nothing happens out of the goodness of peoples' hearts. Entrenched beliefs and practices do not die easily. Thus, groups which have less than parity need to be organizing and planning new strategies to deal with ongoing economic, social, political, and educational issues.

School boards and educators must find courage enough to plan, experiment and make desegregation work where possible. Examples cited by the U.S. Commission on Civil Rights in *Fulfilling the Letter and Spirit of the Law* show that educational planning coupled with assistance from local leaders works positively.

In most large cities, however, desegregation of schools is not likely to occur. It certainly will not occur in the near future unless segregated housing patterns change. It is segregated housing patterns, coupled with economic insufficiency, that insure that large-city school desegregation is unlikely because schooling arrangements still are based largely on residential location. In fact, unless a major change is forthcoming very soon in public policy concerning housing, segregated housing and schooling patterns will *increase*. Old-fashioned *de jure* segregation is no longer needed when rapidly escalating prices rule most people, Black and white, out of the current housing market. Discrimination becomes more subtle, and it is harder to prove discriminatory intent.

Revised, creative housing policies and financial incentives need to be forthcoming in the immediate future from the Department of Housing and Urban Development for middle-income and low-income people. An expansion of the urban homesteading concept will help families and the schools their children will populate. Black, white, and other families will be attracted by the fiscal arrangements and the innovative possibilities of taking the initiative to restore their own subcommunities and schools. Schools in those areas will then be occupied by children of people who cross social class and racial lines, joined in common efforts to be human and to live, grow, and contribute well in their habitats.

Unemployment and insufficient income plague many minority families; large numbers of majority group families are affected as well. Even with revised, creative housing policies and fiscal incentives many of these families could not take advantage of them because of inadequate income. Unless broad, long-range and short-range public policies are developed for employment and housing, my feeling is that public school desegregation has gone about as far as it will go. The future will see stabilizing of what exists, or regression.

With respect to employment in public schools, there are continuing problems for minorities and women. Employment problems will escalate for them in the future as competition becomes keener for slots. Some schools are closing because of insufficient enrollments due to the declining birth rates. Other school systems face fiscal problems and are not retaining non-tenure teachers. Widespread discrimination is alleged in the New York City school system's policies of hiring, assigning, and promoting minorities and women.⁴⁸ In Chicago it is alleged that transfer practices continue to move excellent Black teachers out of Black schools to

⁴⁸"New York City Reflected in Its Schools," *New York Times*, November 14, 1976.

white schools, thus taking them out of the Black communities' schools in which they are providing models of excellence for the young, along with expert teaching. Such practices need to be stopped in the future, unless those teachers are replaced by others of equal stature.

Further, we can see a reinstitution of policies of passing standardized tests for employment as teachers and principals. Review boards and oral examinations for job placement are being revived. Thus, in the future, Black teachers and principals will have to pass these tests in order to be employed. It will be up to them as individuals and to their preparatory institutions to see that they possess the knowledge to pass these hurdles. Review boards must be monitored with respect to their decisions and the criteria for those decisions. Otherwise review boards become very discriminatory, a hurdle of the last resort which cannot be overcome.

With respect to students, today many of the brightest, most highly-motivated Black youth are in private schools or parochial schools, not in public schools. Parents who have placed their young in private or parochial schools are not likely to re-enroll them in public schools as long as severe discipline problems prevail and low aspirations and achievement are the norm.

Black elementary and secondary students must decide, with the assistance of their parents and teachers, that they will achieve in school. Their mass underachievement is supportive in the public mind of inferiority, and many people do not believe there are educational merits in desegregation because of the low achievement of Black youth. They *can* learn; they *must* do so in the future for their own survival in a complex, technological world.

Historically, minorities usually have failed at attempts to gain and retain community control over the public schools their children attend. They will need to work harder to attain this goal in the future. While I have very mixed feelings about alternative school proposals (some of them are positive, but others are destructive of the concept of public education), there is hope in some of them for a community school approach within the community development concept.

At the level of higher education, Black enrollment has grown markedly in the last decade. This gain can mean that the occupational status and income levels of more Blacks can be enhanced in the near future. But the gains are not likely to continue if the present dropout rates remain large at the secondary and junior college levels. Also, decreasing financial aid and increasing college costs mean that more Blacks will be eliminated from higher education in the future, except perhaps at lower-cost community col-

leges. Policies and programs need to be addressed to the dropout problem, the distribution problem (too many Blacks are in public two-year or community colleges or trade schools), and the financial problem.

Public Black colleges are in jeopardy, I think, because of decisions being made based on the *Adams* rulings. Blacks must fight now and in the near future for the retention of Black public colleges as viable educative institutions which will not exclude whites, but which will meet the unique needs of Blacks and other minorities. Also, many private Black colleges are in jeopardy because of financial insufficiencies and/or shortages of enrolling students. Black citizens *must* establish a tradition of giving to support private Black colleges in the future. It is only with the financial and moral support of these private Black colleges that "Black higher education" can be guaranteed for the future.

There is no doubt that conservative elements of American society would like to see *Brown reversed*; that must be prevented in the future. We have lived through 23 years of subversion of the intent of *Brown*; there has been more deliberation than speed in desegregation. Support is needed throughout American society for affirmative action policies, at least for one full educational generation. These policies provide for a reversal of the discrimination which Blacks, other minorities, and women suffered for so long as a result of public policies. Surely it is not too much to ask total support for policies of recompense up to 1990.

In the future the National Institute of Education should be made the real equivalent of the National Institute of Health, a national center where educational problems are carefully and systematically defined, examined, and from which results of research are disseminated to make education a more workable and successful experience. In addition, as I said in *The Crisis*,⁴⁹ educational goal setting in the future should include the planning for, study, and evaluation of:

1. Providing communities with educational alternatives in its learning environments supported by tax monies, e.g., open schools, structured schools, schools without walls, etc., based on the theory that in this complex society no single school plan is best for all the children of all the people.

2. Matching teachers, learners, and learning environments by means of stated preference and of judgments as to which children learn best with what kind of teacher and methodology in what kind of school.

⁴⁹Faustine C. Jones, "Educational Goal Setting," *The Crisis*, LXXXIV (January, 1977), 11.

3. Choosing teachers and principals, very carefully selecting people who have both a personal and professional commitment to public educational success, and to the enhancement of all children, regardless of race, sex, social class, or other factors resulting from accident of birth.

4. Providing special training for teachers of children who have identifiable special needs, e.g., out of the ordinary, as the mentally retarded, deaf, mute, emotionally disturbed. Establish a much lower teacher/pupil ratio for these classes, and special physical facilities.

5. Experiments to find suitable measurements for non-academic variables.

6. Developing research methods suitable to action programs which are constantly changing directions.

7. Providing continuous staff development training for teachers and administrators based on the principles of life-long learning, reinforcement, and personal/professional growth.

8. Providing for student, parent and community inputs and cooperation into the entire educational process. Advice, cooperation, assistance, and evaluation are the key ingredients to reduction of student/school/parent/community conflict.

9. Devising fair and equitable ways of releasing teachers and administrators who refuse to grow, change, develop, and contribute to the enhancement of schools and children.

10. Improving materials and methods of traditional instruction.

11. Increased and improved use of new technology—hardware and software.

12. Incentives to increase the numbers of students who complete high school and go on to higher education.

Finally, future planning must find a way to eliminate glaring inequities in per pupil expenditures in the states where they exist today. While expenditures alone will not guarantee educational equity, the present glaring inequities do guarantee a continuation of inequality.

Some of the above-stated goals are being met in particular buildings or particular communities, but this is limited and short-term in light of human needs. There is today no nationwide effort on a long-term basis on which the people of this nation can depend. In fact, some Americans are suggesting that the whole concept of public schools be abandoned. It will be disastrous to Blacks and other minorities if that should happen. It is, instead, a prolonged, deep-seated commitment to public-supported educational success that the people of America need today and in the future.

School Desegregation in Retrospect and Prospect

Leon Jones, *Psychoeducational Studies Research and
Methodology, School of Education, Howard University*

Desegregation in education remains among the foremost issues confronting the public school systems of the United States today. Progress in this area has been minimal at best. A critical analysis of the school desegregation issue presents a bleak picture, for "desegregation did not mean integration,"¹ and, today more Black children attend segregated schools than at any time since the historic 1954 *Brown v. Board of Education of Topeka, Kansas* decision which declared segregated schools unconstitutional.²

At the time of *Brown*, two concerns prevailed: (1) for the segregationist—that federally enforced public school integration would lead to the comingling of white and Negro public school pupils; (2) for the supporters of desegregation—that many meaningful Federal court decisions supportive of desegregation were soon forthcoming. These concerns, Carter states, proved to be myths.³

In the months and weeks leading up to the *Brown* decision, many southern communities floated generous school bonds to build new Negro facilities and to remodel old ones in an effort to blunt the momentum favoring desegregation. The need for new and better school facilities had reached grave proportions by this time. As late as 1930, there were approximately a million Black youths of high school age out of school. Ambrose Caliver, Senior Specialist for the Higher Education of Negroes, U.S. Office of Education, and his colleague, J. H. Douglas, reported that at least half of those Black students had no high schools available to them in the 230 counties in which they represented one-eighth or more of the population.⁴ It is understandable how no schools were available for hundreds of thousands of Blacks at the time of the

Plessy v. Ferguson decision of 1896 which established the “separate but equal” doctrine.⁵ In 1896, the conditions of public education did not approximate the existing conditions at the time of the *Brown* decision, even in the North—the school term was a mere three months a year in many states. However, the matter of no schools for hundreds of thousands of Blacks as recently as 1954 invites serious questions about the profound ill-effects of segregation on Black Americans.

Shortly after the *Brown* decision, U.S. Navy Admiral H. G. Rickover was very critical of the educational standards of the nation’s schools.⁶ He pointed out that in recent years our schools had done an efficient job of making Americans out of motley groups of foreigners from all corners of the globe. Perhaps, some hundreds of thousands of Vietnamese refugees now represent a high priority in this regard. But Rickover was critical of what our schools were doing for Americans.

A legislative program for the Federal guarantee of racial equality began to take form after the Civil War. This program, initiated by northern, and modified by southern, ideals and politics has often been thwarted and occasionally supported by the U.S. Supreme Court. The program first produced the Thirteenth Amendment of 1865 which abolished slavery and involuntary servitude. Three years later (1868), the Fourteenth Amendment, which offers individuals equal protection under the law, was adopted.

The Fourteenth Amendment served as an important precedent for arguments in both the *Plessy v. Ferguson* and the *Brown v. Topeka* cases. In 1896, the U.S. Supreme Court handed down the *Plessy* decision dealing with racial segregation on railroad trains, but the Court also endorsed school segregation. In so doing, it cited an 1849 decision by the Massachusetts Supreme Court upholding school segregation in Boston. The Court went on to deny the argument that compulsory segregation of the races was so detrimental to the Negro that it actually stamped him with a badge of inferiority. This conclusion was overruled in the unanimous decision of 1954, when U.S. Supreme Court Chief Justice Earl Warren approvingly quoted the lower court’s findings in the *Brown* case: “. . . to separate them [Negro students] from others of similar age and qualifications solely because of their race generates a feeling of inferiority as (sic) their status in the community that may affect their hearts and minds in a way unlikely ever to be undone.”⁷

THE IMPACT OF THE BROWN DECISION ON THE PUBLIC SCHOOLS

By its nature, Congress is greatly influenced by the national and international mood. Therefore, it came as no surprise that the congressional passage of the Civil Rights Act of 1964 followed the assassination of President John F. Kennedy, a friend to the Civil Rights Movement. It has been argued that the U.S. Supreme Court was influenced by the national and international mood in its *Brown* decision. In any case, the effects and legal implications of this decision were particularly significant for the South.

De jure segregation practices in the 17 southern states and the District of Columbia were affected by the Brown decision, which might explain the differences between the initial effects of the decision in the border states and the Deep South. The District of Columbia and such border states as Delaware, Kentucky, Maryland, Missouri, and West Virginia received early praise in their implementation of the Brown decision. The city of Baltimore was hailed for its successful efforts in 1954; Washington, D.C., was credited as setting an example for the nation that same year; and St. Louis received an "A" rating from a leading magazine in 1955 for its desegregation achievements. Political and socio-economic factors and the proximity of the northern tradition to these cities placed the implementation of the *Brown* decision under different and more favorable conditions than those of the Deep South.

In addition to the geographical conditions, the sociological frame of mind and psychological attitude of influential people differed markedly in each region. For example, the Maryland Standing Commission on Interracial Problems (1954) indicated that compulsory racial segregation in the Baltimore Public Schools System was abolished at the start of the fall semester immediately following the Supreme Court decision in May, 1954. Officials in Washington, D.C. pondered the issue as *Newsweek* magazine asked: "If Washington, D.C. could not carry out the school desegregation ruling gracefully, then how could the southern states be expected to do so?"⁸ Integration in the St. Louis Public Schools went smoothly and almost without incident.⁹ With the exception of technical high schools and the adult education program, all high schools under the School Board's control were integrated by the beginning of the second semester on January 31, 1955.

the South reveals contrasting results during the first few years after *Brown*. In 1954, Georgia Governor Herman Talmadge voiced the general mood of the South when he said: "The Supreme Court has reduced our Constitution to a mere scrap of paper."¹⁰ Many predicted that the South would not respond to the Supreme Court's demand. In fact, a group of southerners appealed to the Court for delays. Critics spoke of the relief on the part of many southern educators that the Court did not fix a date for racial integration in all schools—a form of victory for the South.

On May 31, 1955, just a year after the desegregation decision, the Supreme Court gave local authorities the initiative to implement that ruling. School officials were ordered to work out their own desegregation plans "with all deliberate speed."¹¹ Early results of the local authorities' initiative were desegregation patterns ranging from the commitment by Maryland to "do its best" to Georgia's "under no circumstance."¹² By late 1955, Virginia had worked out a school program which became widely regarded as the South's answer to the Supreme Court's decree. Its covert aim was to preserve segregation while avoiding conflict with the Court. However, this program ultimately led to the closing of its schools to Blacks in Prince Edward County in 1959.

For the most part, from the southerner's point of view, the *Brown* decision was morally wrong. Stiff resistance to the implementation of *Brown* ran rampant during the ensuing years. In discussing the southern case against integration, Waring,¹³ a journalist for *Harper's Magazine*, considered health, home environment, marital habits, crime, and intellectual development as major elements contributing to the southerner's negative views about racial integration. Waring concluded that much of the South felt that if pressure were placed on southerners to desegregate, reactions might be unfavorable to the entire community. Sporadic outbreaks of Ku Klux Klan activity, the formation of the Citizen's Councils and other "protective" organizations not only discouraged southern desegregation, but also resulted in violence and intimidation.

In 1955, *Time* magazine reviewed the status of desegregation

¹⁰"Talmadge and Segregation: He Makes His Stand," *Newsweek*, XLIV (May 31, 1954), 31-32.

¹¹*Brown v. Board of Education of Topeka, Kansas et al.*, 349 U.S. 294 (1955). Hereafter referred to as *Brown II*.

¹³T. Waring, "The Southern Case Against Desegregation," *Harper's Magazine*, CCXII (January, 1956), 39.

efforts in the 17 southern and border states,¹⁴ grading them from "A" to "F" as follows: "A"—Missouri; "A-minus"—West Virginia; "B-plus"—Kentucky, Oklahoma; "B-minus"—Maryland; "C-plus"—Arkansas, Texas; "C"—Delaware, Tennessee; "C-minus"—North Carolina; "D-plus"—Virginia; "D"—Florida; "F"—Alabama, Georgia, Louisiana, Mississippi, South Carolina. Thus, a full year after *Brown*, only one state, according to *Time*, had moved enough toward desegregation of public schools to warrant a grade of "A."

Following the Supreme Court's deliberate speed ruling, the implementation of the *Brown* decision rested largely with the Federal and lower courts. At the beginning of the '60s (February 1, 1960), the school desegregation efforts gained the support of the Civil Rights Movement. This marks the beginning of the "freedom rides" which were followed by widespread "sit-in" demonstrations.

The passage of the Civil Rights Act of 1964 provided the impetus for renewed hope regarding the implementation of *Brown*. It paved the way for the emergence of a new thrust in this struggle, the racial imbalance issue. Elements of this issue were put in force as early as 1965 in the form of busing Black pupils to reduce *de facto* segregation. The compulsory busing of white pupils in an effort to insure racially balanced schools followed, thus giving rise to the present controversial form of the busing issue.

OUTCOMES OF DESEGREGATION EFFORTS

In a 1967 report on school desegregation in the South,¹⁵ the U.S. Commission on Civil Rights concluded that the vast majority of Blacks who finished high school in the spring of 1967 had never attended one class with a single white student. The results of the study came at the time when the desegregation impact of the Civil Rights Act of 1964 was beginning to facilitate desegregation in the southern states. It indicated that we had educated a whole generation of children in inferior schools since *Brown*. In fact, as late as the end of the 1972-73 school year, 63 per cent of the nation's Black children attended predominantly Black schools.¹⁶ In the 11 states of the Deep South, 46 per cent of the Black students were attending schools that were 80 per cent or more Black, compared to 28 per cent in the northern and western states.¹⁷

¹⁴"Report Card: Progress of the States Toward School Desegregation," *Time*, LXVI (September 19, 1955), 25.

¹⁷B. Barnes, "School Integration Highest in South," *The Washington Post*, July 16, 1974, p. A7.

Differences in the quality of education available to Black and white students attending separate schools have been known for decades. In 1967, the U.S. Commission on Civil Rights reiterated that schools attended by white children often have more library volumes per student, advanced courses, and fewer pupils per teacher than schools attended by Black children. Black students were more likely than whites to have teachers with lower verbal achievement levels, substitute teachers, and teachers dissatisfied with their assignment. The Commission contended that teachers and students in such schools recognize the stigma of inferiority attached to their schools, which has a negative effect on their attitudes and achievement.¹⁸

As intimated earlier, only two and one-half million Blacks attended segregated schools at the time of the *Brown* decision of 1954, whereas this number had increased to four and one-quarter million by 1973.¹⁹ This represents a 70 per cent increase in the number of Blacks attending segregated schools after nearly 20 years of desegregation efforts. The “white flight” to suburbia, white student increases in private school enrollment, as well as desegregation delay tactics all contributed to this increase.

The consequences of desegregation efforts in the South have differed markedly from those of *de facto* practices in the North. In the South, Black students have been subjected to more unwarranted disciplinary action and far more suspensions, to be sure, than their white counterparts.²⁰ It has been estimated that as many as a half million white pupils have been enrolled in all-white private “academies” in the South. Desegregation also meant that thousands of Black teachers and educators in the South lost their jobs, were demoted, or were denied promotion. At the time of the *Brown* decision, Black students in the southern states accounted for 23 per cent of the school population, and Black teachers for 21 per cent. By 1972, the Black student population had increased to 26 per cent, but Black teachers had been reduced to 17 per cent.

The escape mechanism of white students enrolling in private academies is not peculiar to the South. In 1966, Dilworth,²¹ a Philadelphia school superintendent, claimed that approximately 40 per cent of the total school population of Philadelphia was in parochial and private schools. So, while only 30 per cent of the city’s

population was non-white, the public schools were 57 per cent non-white and there were more white children in the parochial and private school systems than in the city's entire public school system. Dilworth predicted that, if this trend continued, public school systems in our big cities would be almost entirely non-white in 10 or 15 years.

Seemingly unwarranted disciplinary action and the ease with which suspensions are issued to Blacks appear to be far more prevalent in the newly desegregated South than in the North. In 1973, the Southern Regional Council entitled its fall report: "Blacks Target of 'Pushouts.'" ²² This examined part of a pattern of continuing large and disproportionate numbers of minority students that had been suspended, expelled, and induced to drop out of many desegregated school systems. Unfortunately, desegregation often puts Black students into schools dominated by white culture and tradition. The report says that school confrontations are provoked through discrimination in disciplining Black students, use of Confederate symbols, and the displacement of Black principals, teachers, and coaches. This leaves Black students without Black role models. Dress codes and school regulations are too easily manipulated in an unfair and arbitrary manner to restrict contemporary life styles often first introduced by Blacks. The curriculum remains oriented around white middle-class college-bound students.

Black parents have had a profound impact on *de facto* segregation of the non-South regions of the United States. The legal suits initiated by Black parents whose children were victims of racially isolated schools ²³ precipitated a trend in court cases against *de facto* segregation in these parts of the country. Black parents in various northern cities began filing lawsuits similar to those in the South to move their children from inferior racially isolated schools into the better desegregated schools.

Among the earliest significant setbacks was *Bell v. School City of Gary, Indiana* ²⁴ in 1963, in which the argument failed that racial isolation in the public schools, whether or not caused directly by school officials, unconstitutionally deprived Black children of equal opportunity. In more recent cases, the NAACP's Legal Defense and Educational Fund and others have set out to show that the existing school segregation resulting from state and local

²²Austin Scott, "Blacks Target of Pushouts," *The Washington Post*, November 29, 1973, p. A3.

²³In its report *Racial Isolation in the Public Schools* (see footnote #18), the U.S. Commission on Civil Rights set forth a differentiation between the terms "racial isolation" and "segregation." Even though these terms are sometimes used interchangeably, the latter is a legal description and the former is more prevalent in the social sciences.

²⁴*Bell v. School City of Gary, Indiana*, Civil No. 3346, 1963.

action by school authorities has a similar effect and intent as the *de jure* segregation of the South.

It seems unlikely that the Supreme Court will review northern decisions ambitiously. The issue of crossing school district boundary lines to desegregate was considered by the Court for the first time in *Milliken v. Bradley*.²⁵ Previously established constitutional principles were reaffirmed, including the use of transportation to overcome segregation. Nevertheless, the decision represented a setback in efforts to desegregate urban school districts, particularly in the North, but apparently in the South as well.

Following the passage of the Civil Rights Act of 1964, desegregation efforts were on the increase. A corollary to increased desegregation was the assumption that stepped-up busing must accompany stepped-up desegregation plans. This assumption and the verbalization of "busing" as a means of accomplishing racial balance within the schools paved the way for the busing controversy. This controversy, augmented by the Coleman Report²⁶ of 1966, soon reached a crisis level. Ironically, as early as 1972, a study by the Secretary of the United States Department of Transportation revealed that less than one per cent of the annual increase in busing could be attributed to desegregation.²⁷

According to *Racial Isolation in the Public Schools*,²⁸ a Black parent in North Carolina said, "I contend that busing for one year will upgrade all our schools quicker than anything the President or Congress can do." It affirmed that, "(w)ithin one month, the parents of white children who were bused managed to get the Black school painted, repairs made, new electric typewriters and sewing machines, and the shelves filled with books."

Attitude and achievement factors have important future implications in the desegregation struggle; they have maintained a predominant role throughout. If by attitude we think in terms of the way one feels, acts, and behaves regarding desegregation efforts, then attitudinal factors cut across the political, educational, sociological, psychological, clerical, business, lay, and parental strata. Moreover, upon considering the pervasiveness of the attitudinal aspects of some desegregation proposals, it seems reasonable that attitude might continue to play an important role in any future desegregation efforts.

A principal motivating factor in efforts toward integration has

²⁵*Milliken et al. v. Bradley et al.*, 418 U.S. 717, (1974).

²⁶James S. Coleman *et al.*, *Equality of Educational Opportunity* (Washington, D.C.: U.S. Office of Education, 1966).

²⁷John Volpe, Former U.S. Secretary of Transportation, Letter of Transmittal, Report to the National Traffic Safety Administration, March 24, 1972.

²⁸U.S. Commission on Civil Rights, *Racial Isolation . . .*, *op. cit.*, p. 4.

been the assumption that Black children's achievement and motivation improves in an integrated school environment. The Coleman Report,²⁹ a study of the state of desegregation in the public schools and the impact of the Civil Rights Act on desegregated public education, was praised by some and damned by others. It contended that educational achievement is unrelated to educational financing and that social integration is an important factor in improving the educational achievement of Black students. This was the first report to demonstrate that Black students achieve better in integrated schools simply because their classmates are white. This finding prompted the U.S. Commission on Civil Rights, in 1967, to state unequivocally that "Negro children suffer serious harm when their education takes place in public schools which are racially segregated, whatever the source of such segregation may be. Negro children who attend predominantly Negro schools do not achieve as well as other children, Negro and white."³⁰ However, it should be noted that Nancy St. John, a social scientist whose study of segregation dates back to 1948, posits that adequate data have not been gathered to determine a causal relation between school racial composition and academic achievement.³¹ She claims that more than a decade of considerable research efforts have produced no definite positive findings.

At the end of 1965, a year after the Civil Rights Bill became law, only two per cent of the Black students in Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, and Virginia (the Deep South) were attending schools with white students. In some cases this two per cent level of desegregation was precipitated by the small number of Blacks and was accomplished by busing. However, even such a low percentage represented a measure of progress for the Deep South. On the other hand, the North and West have now embarked on their own era of political and legal strife over school desegregation.

NIXON'S IMPACT ON DESEGREGATION EFFORTS

The momentum of the Civil Rights Movement and the Civil Rights Act spearheaded a successful drive for integration which manifested itself during Richard Nixon's first term in office. Prior to that term, however, Nixon made his anti-busing stand a campaign issue. Indeed, as President he provided the impetus for much

²⁹Coleman, *op. cit.*

³⁰U.S. Commission on Civil Rights, *Racial Isolation . . .*, *op. cit.*, p. 1.

³¹Nancy St. John, *School Desegregation: Outcomes for Children* (New York: John Wiley and Sons, 1975).

of the busing controversy which reached the crisis level in the early 1970s. Therefore, it seems fitting to devote special attention to former President Nixon and his impact on desegregation efforts and the public schools.

Desegregation today appears to be as incomplete in the North as it is the South. Fourteen of the nation's largest cities accommodate one-third of all the Black students enrolled in the public schools. These students attend predominantly Black, i.e., *de facto* segregated, schools. It is no wonder that, in 1975, NAACP attorney Norman Chachkin remarked: "If the Court wants to review the northern decisions around the country as carefully as it did those from the South, then be assured that there will be a great deal of desegregation coming up."³²

As the impact of the anti-desegregation strategies of the Nixon administration began to have their adverse effects on desegregation efforts in the early 1970s, court-ordered desegregation activity slowed considerably. On March 16, 1973, President Nixon told the nation that lower courts have gone beyond what the Supreme Court said was necessary in requiring busing.³³ The catalytic effect of this presidential move represented a measure of victory to opponents of desegregation by encouraging the courts to slow down the pace of desegregation activity in the public schools.

The negative impact of Nixon's stand on desegregation efforts transcended the courts. About the same time that he spoke to the courts, it was reported that "(t)he Department of Health, Education and Welfare and the Department of Justice, mandated by the Constitution and Federal law to be the guarantors of equal educational opportunity, had largely relinquished their legal and moral functions under the Nixon administration" merely by turning "deaf ears" and "blind eyes" to persistent denials of equal protection of the laws.³⁴ Apparently, these "deaf ears" and "blind eyes" have not yet returned to normalcy.

In a *New York Times* interview³⁵ the assistant attorney general for civil rights, J. Stanley Pottinger, denied that the administration had turned its back on integration, but he acknowledged that there was little political pressure for it. Others shared Pottinger's view. The Black militants considered desegregation efforts a lost

³²Norman Chachkin, "Dual Schools Still a Problem but Now It Is in the North," *New York Times*, April 21, 1974, p. E5.

cause prior to the end of the sixties and they lost patience with faltering desegregation efforts.³⁶

The Nixon administration took advantage of the newly coined “unitary schools” concept which resulted from the *Alexander v. Holmes* case in which the Supreme Court held that it was the obligation of every school district to terminate dual school systems “at once” and to operate only unitary schools.³⁷ In 1970, the officials of the Department of Justice and the Department of HEW claimed that over 90 per cent of southern Black children were attending school in “unitary” systems. In fact, on December 7, 1970, Elliot Richardson, then Secretary of HEW, said that there were only 76 school systems among the 2700 in the entire South that had not carried out desegregation plans.³⁸ In fact, the Secretary asserted that in 1970, “90.5 per cent of all black children in the South were attending desegregated systems.”³⁹ These figures would indicate that the job of desegregating southern schools was largely done by 1970; but nothing could be more misleading. Before 1970–71, HEW measured desegregation progress by the percentage of Black children attending desegregated schools. Beginning with the 1970–71 school year, the Government arrived at a success figure by measuring the number of Black children attending desegregated or unitary school systems. But under the Nixon administration’s view a school system could be “unitary” and yet consist of segregated schools—one desegregated or unitary school per system was sufficient to qualify the entire system as “unitary.” Unfortunately, many Black students continue to attend predominantly Black schools.

The Supreme Court’s *Milliken v. Bradley* decision of 1974, rejecting desegregation across school district lines, was denounced by one of the dissenting justices as a “giant step” backwards for the highest court in the land. Four of the five justices supporting this ruling were appointed to the bench by former President Nixon.

RECOMMENDATIONS FOR THE FUTURE

Because the courts and the Federal Government have been ambivalent in their implementation of the *Brown* decision, educational planners and policy makers of the future must rise above the history of failures and marginal successes of desegregation efforts resulting in the steady increase of the number of Black children at-

³⁶*Ibid.*

³⁹*Ibid.*

tending segregated schools. It is not enough for them to identify or to define a new desegregation strategy. It would appear that educational planners should abandon the entire concept of "desegregation" and all of its attendant ramifications at *greater than* "deliberate speed." What is sorely needed in public education today is a genuine, concentrated emphasis on *school integration*. The successful implementation of the *Brown* decision rests not on *new* strategies, but on *old* ones.

Original efforts to implement the *Brown* decision invoked the notion of integration of the schools. The idea of integrated schooling was embedded in the uniform-education-for-all spiel which played a significant role in shaping the psychology of the American public in the years following the landmark *Brown* decision. Since integrated schooling has never really been tried on a large scale and since desegregated schooling has failed miserably and, indeed, it has been reduced to *de facto* segregated schooling, then it seems that integrated schooling as an operational concept deserves the utmost attention of future education planners.

Time for the Teachers: Putting Educators Back Into the Brown Remedy

Derrick Bell, *Dean, University of Oregon Law School*

If I had to prepare *Brown* today, instead of looking principally to the social scientists to demonstrate the adverse consequences of segregation, I would seek to recruit educators to formulate a concrete definition of the meaning of equality in education, and I would base my argument on that definition and seek to persuade the Court that equal education in its constitutional dimensions must, at the very least, conform to the contours of equal education as defined by the educators.

Judge Robert L. Carter
former NAACP General Counsel¹

A TARDY RETROSPECTIVE

In trying to think through the factors that brought us to the current deteriorated state of school desegregation, I remembered the unorthodox approach to marriage suggested to me years ago by a quite determined young, black woman. Her name was Ellen Jean. Years before the advent of the Women's Liberation Movement, she told me with great certainty, "Derrick, I intend to search for the right man with my head, and when I find him, I will insert my heart."

At the time, I was young, viewed marriage as a continuation of the romantic adventure that preceded it, and thought my friend quite the hard-hearted Hannah. I don't know whether Ellen Jean was successful with her formula, but given the divorce-strewn marital landscape in the country today, hers was at least as sensible an approach to choosing a spouse as the "lifetime romance" vision of marriage that remains so tempting even when we know it is a rose-colored mirage.

¹Robert L. Carter, "A Reassessment of *Brown v. Board*," in Derrick A. Bell, ed., *Shades of Brown: New Perspectives on School Desegregation* (New York: Teachers College Press, 1980), pp. 21-27.

Similarly, looking back on my more than twenty-five years of involvement with school desegregation (the Supreme Court's decision in *Brown v. Board of Education*² was decided the spring before I entered law school), I fear that too many of us embraced school integration with our hearts and ignored the pragmatic considerations that might have become apparent had we approached the whole matter with our heads.

As with romance, experience taught us little, and that learning we ignored. The Emancipation Proclamation was supposed to free the slaves. By its very terms, limiting coverage to those slaves resident in states still under Confederate rule and thus beyond Union authority, we learned that it did not. The Civil War Amendments were promoted as the answer to efforts to return the former slaves to a new, more vicious servitude, but when the interests of the nation turned elsewhere, the laws based on those Amendments were not enforced or, when enforced, were declared unconstitutional.

In approving the "separate but equal" doctrine, the Supreme Court mandated that segregated facilities for blacks must be equal.³ As we learned and, by that time, should have expected, only the "separate" part of segregation policy was taken seriously and rigorously enforced. The equality portion of the social formula was applied by courts only when the disparities shocked the white conscience, which on this issue was a well-insulated measuring device indeed.⁴ Out of these experiences, we concluded that black children would never get an equal education unless public schools were desegregated.

W.E.B. Du Bois did not disagree, but he recognized that good schooling could take place if parents supported the school. As early as 1935, he admonished blacks who "fight frenziedly" to desegregate a school only to lose interest if their efforts fail, thereby insuring that their last argument, that nothing of educational value could come from a segregated school, would become a self-fulfilling prophecy.⁵ In short, he urged blacks not to forget the message of

²347 U.S. 483 (1954).

³*Plessy v. Ferguson*, 163 U.S. 537 (1896).

⁴Prior to *Brown*, state courts sometimes ordered black children admitted to white schools when no provision was made by school boards for their schooling. See, e.g., *Ottawa v. Tinnon*, 26 Kan. 1 (1881). The cases are gathered and discussed in Derrick A. Bell, Jr., *Race, Racism and American Law*, (Boston: Little, Brown & Co., 1980), pp. 368–371.

In the decade before *Brown*, the Supreme Court followed this philosophy in ordering blacks admitted to graduate training provided by the state for whites where no similar provision was made for blacks. See, e.g., *Missouri ex rel. Gaines v. Canada*, 305 U.S. 337 (1938); *Sweatt v. Painter*, 339 U.S. 629 (1950).

⁵W. E. B. Du Bois, "Does the Negro Need Separate Schools?" *Journal of Negro Education*, 4 (1935), 328–332.

his article: “*The Negro needs neither segregated schools nor mixed schools. What he needs is Education.*”⁶ Dr. Du Bois would not have been surprised when blacks at last became entitled to desegregated schools that we would literally lust for racially balanced schools and promptly suppress all memory of the wondrous teachers and principals who, despite the restraints of “separate but equal” policies, somehow enabled generations of black children to learn enough to both survive and fight successfully for school desegregation.

Dr. Du Bois warned that the South would not comply with the decision for many years, “long enough to ruin the education of millions of black and white children.”⁷ And, he predicted, accurately as proved by later events, that the desegregation process would result in the dismissal of thousands of black teachers and the loss of black history and culture.⁸

Our poor judgment was perhaps understandable. It had taken two decades of dedicated legal work by civil rights lawyers and their black clients to convince the Court that the societal subordination of a whole people by requiring their restriction to separate areas of every imaginable public facility did not equate with any serious interpretation of the Fourteenth Amendment’s equal protection of the laws mandate.

And even our best arguments might not have been sufficient to convince the Court of the obvious had not at least the formal abandonment of racial segregation been needed to enable the country to compete with Communist powers for the political alliance of millions of third-world people who were emerging from Colonialism after World War II.

But having acknowledged what every black parent knew about schools segregated by law, the Court did little more for the next decade than warn those involved in massive resistance movements that orders of the Federal court must be obeyed. Having conveyed that message, the courts issued very few orders that furthered rather than delayed the school desegregation process.

Then, in response to the myriad schemes effected by school boards intended to evade compliance with *Brown’s* desegregation mandate, civil rights lawyers and their supporting organizations came to condemn every school whose population was black, viewing all-black as synonymous with segregated. Such schools, we argued, were both educationally bad and morally evil.

⁶Ibid, p. 335.

⁷W. DuBois, *The Autobiography of W. E. B. Du Bois*, ed. by Herbert Aptheker (New York: International Publishing Co., 1968), p. 333.

⁸Du Bois, “Two Hundred Years of Segregated Schools,” in Philip S. Foner, ed., *W. E. B. Du Bois Speaks: Speeches and Addresses 1920–63*, (New York: Pathfinder Press, Inc., 1977), pp. 278–284.

The goal, to racially balance every school in every school system, was deemed the only decent definition of desegregation, and we equated such a school with both educational effectiveness and moral right. Civil rights lawyers went so far as to argue that racially balanced schools were preferable even if the black children were doing less well academically than they had in segregated facilities.⁹

When, usually after long years of effort, a school system was desegregated, we characterized the continuing discrimination in the school as “second-generation” segregation problems. Closer examination revealed these difficulties as simply new means of continuing the old priority of distributing educational resources: whites get what they need, and blacks get whatever is left.

Even when gross jim-crowlike schemes, which included maintaining segregated classes within “integrated schools”¹⁰ and assigning students by “ability groupings,”¹¹ were ordered abandoned by the courts, we were slow to recognize how effectively black children could be denied the “equal education opportunity” promised by *Brown* despite compliance with court orders prohibiting the maintenance of all-black schools.

The fact is that in most urban areas of any size, the segregation of residential areas along racial and economic lines translates into most black children attending public schools that are mainly black. When in 1974,¹² the Supreme Court set extremely hard to meet standards for consolidating mainly white suburban school systems with their inner-city counterparts, the necessary proof could be found in only a few formerly *de jure* segregated districts,¹³ and the current patterns of school assignment became inevitable and irreversible.

As of the 1980–81 school year, millions of black students in the South were attending desegregated schools. Most of this desegregation occurred over a decade ago, and in more recent years, southern school systems have become more segregated. But almost half of the black students in the Northeast experienced little desegregation in schools that were from 90 to 100 percent minority. All told, 63 percent of the black students around the country attended

racially isolated schools.¹⁴

School desegregation litigation continues; and over strident dissents, the Supreme Court has generally been content to deny review to traditional desegregation orders, including those requiring what lower courts deem reasonable amounts of busing to achieve desegregation.¹⁵

When mandatory busing orders are not supported by Federal standards requiring proof of intentional discrimination, the Court has refused to approve them.¹⁶ But successful litigation outcomes will no longer disguise the fact that equal educational opportunity will not be gained for scores of poor minority children through traditional desegregation orders calling for remedies that rely on racial balance in school assignments. In the current phases of the continuing effort to obtain an effective education for black children, lawyers and lawsuits will play a role, but it will be now what, perhaps, it should have been all along: a supporting role to the lead of black educators.

RELiance ON THE TEACHERS

Of all the lawyers who labored on the school cases that led to the victory in *Brown v. Board of Education*, few have published their thoughts on the outcomes of that momentous decision, and none have been more thoughtful and honest in their reappraisal than the former NAACP general counsel, and now a Federal district court judge, Robert L. Carter.¹⁷

Objectivity about an accomplishment of this magnitude is not easy, and many persons have spent the balance of their lives relishing the memory of achievements far less significant than participation in the litigation that led to *Brown*. To put it mildly, most lawyers who took part in the *Brown* case are neither tolerant of criticism nor willing to consider that the legal strategies intended to bring about equal educational opportunity through the mechanism of school integration should be reappraised in the light of contemporary demographic and political realities.

Judge Carter's statements are thus of special value and entitled to far more attention than they have received from those who set policy for civil rights organizations. While he is now a Federal

district judge in the Southern District of New York, he served as a chief legal strategist under now Justice Thurgood Marshall in the decade-long court battles that presaged the *Brown* decision. The major role he played in organizing and presenting the social scientist testimony that served as important support for vital aspects of the *Brown* opinion is recorded in detail in Richard Kluger's history of the school desegregation campaign, *Simple Justice*.¹⁸

In preparing the attack on the "separate but equal" standard, Carter urged the use of social scientists because until the *Brown* decision was handed down, "we had neither sought nor received any guidance from professional educators as to what equal education might connote to them in terms of their educational responsibilities." He admits that he felt no need for such guidance "because of our conviction that equal education meant integrated education. . . ." ¹⁹

The conviction was soundly based on bitter experience. White school officials had concocted every conceivable way to manifest contempt for their "separate but equal" obligations, and the sad evidence of that contempt, from deteriorating school buildings and raggedy school buses, to dog-eared, obsolete texts handed down by the white schools, to too large classes taught by underpaid teaching staffs, all left bitter memories that for many blacks could be erased only by the enrollment of black students in previously all-white schools.

For many blacks, school desegregation became as much a penalty to be inflicted on white parents as a remedy to further the educational needs of black children. And, whatever the motivation, as Judge Carter writes, "Northern and Southern white liberals and blacks looked upon racial segregation by law as *the primary* race relations evil in this country."²⁰ And Carter adds in language that I have quoted many times because, in my view, it represents the penultimate lesson provided by the school desegregation decisions: "It was not until *Brown I* was decided that blacks were able to understand that the fundamental vice was not legally enforced *racial segregation* itself; that this was a mere by-product, a symptom of the greater and more pernicious disease—white supremacy."²¹

Judge Carter's statement which he has expressed in one form or another for a decade and a half,²² should have marked the long-

overdue loss of civil rights innocence. It did not. The romantic notion that integration is the means to as well as the greatly sought end to the long struggle with racism continues to find favor with middle-class liberals of both races.

Happily, there are black educators who, though not invited to participate in school desegregation strategizing, have made impressive strides in evolving techniques to increase, sometimes dramatically, the level of learning in the black schools. It is significant that their success with black children in all-black school settings has generally received more attention from the white media than from civil rights policymakers still committed to the school integration ideal.

Marva Collins, the black teacher in Chicago who resigned from the public schools and opened her own school with her retirement funds, is likely the best known teacher in the country because of her success in teaching ghetto children to read the classics. Periodic excitement is also generated by media reports about the academic exploits of black students in schools like Holy Angel Catholic School in Chicago or Vernum Dei in Los Angeles.²³

In Philadelphia, the all-black Ivy Leaf school is attracting so many students to its academically-oriented program that it has expanded from its elementary and middle-school origins to include a high school.²⁴ And in Los Angeles, the Marcus Garvey School is building a new school that will occupy an entire city block.²⁵ The stories indicate that the schools are responding to black parental disenchantment with the quality of schooling provided by the public schools.

There has been cause for academic excitement in some public schools as well. A few years ago, the *New York Times* in its annual Winter Survey of Education, reported improved reading scores in several predominantly black school districts, among which were Newark, New Orleans, Philadelphia, and Detroit.²⁶ More recently, a national magazine hailed "Washington's Elite School" in a complimentary story about the District of Columbia's Banneker Senior High and its college preparatory program for highly motivated students.²⁷

²³Relevant media stories are collected and discussed in Bell, *Race, Racism and American Law*, p. 428, n. 11–12.

²⁷*Newsweek*, September 21, 1981, p. 80.

In-depth studies of how black inner-city schools achieve success with children who were almost guaranteed scholastic failure have been few. Until recently both educators and their funding sources have given most of their attention to schools desegregated on the racial balance model. Ron Edmond's work indicates that dozens of inner-city public schools are performing well, indicating that the periodic news stories about effective, black schools are more than exotic but nonreplicable phenomena.²⁸

As the instances of successful black schools begin to erode, the generally held view that a black school is, by definition, a poor school, the needed studies should proliferate. Dr. Barbara Sizemore, the former superintendent of the District of Columbia school system, and now on the faculty of the University of Pittsburgh's black studies program, was the principal investigator for a year-long, in-depth study of three Pittsburgh public schools where the majority of pupils met or exceeded national and local norms in reading and math. The schools were 91 percent black and 51 percent or more were poor.²⁹

As in other examinations of successful black schools, the common component was a strong principal willing to give priority to his or her vision of education even over policy directions coming from the central administration. To buck the system, the principal must have the strong support of the parents and the community, and this support can be obtained only if the school makes measurable progress with the students. As one principal told the Sizemore study group:

What you must do is what you have to do within the school setting to improve the education of kids—even if you have to stretch guidelines, alter regulations, even if you have to be a militant or vociferous in your demands, you have to do it. If it means being non-cooperative, then you have to do that, too. If you have to be a rebel, you can be that.³⁰

Teachers at the effective schools were also mavericks. Like the principals to whom they were quite loyal, they have won the support of parents, and they don't worry about personal promotion. They agreed with the principals that their top priority is high achievement. To bring this about, they risked violating union contracts to spend non-class time tutoring pupils, and they worked before and after school to reinforce skills for students who needed extra help. They also made important decisions about instruction,

³⁰*Ibid.*

materials, and student placement and programs.

While teaching techniques varied from school to school, the Sizemore study found that principals and teachers shared the belief and communicated it to students: black and poor children can learn. The schools' low socio-economic status was not a barrier to achievement. And, there are evidently no magic formulas. The school routines identified by Dr. Sizemore in her Pittsburgh study track quite closely the recommendations I had gleaned from earlier studies and included in "A Model Alternative Desegregation Plan."³¹

The effective school policies include: publication of and prompt enforcement of school rules and penalties; daily principal visits to classrooms and rigorous supervision of staff; meaningful parent participation in the school program; close monitoring of students' progress; criterion-referenced tests to determine reading groups; teaching assignments determined on the basis of expertise, not preference; highly structured, self-contained classrooms modified by some teaching and tempered with affection and consideration; using effective teaching materials not approved by the board, especially phonics, mathematics word problems, and black history, culture, and literature.³²

EFFECTING THE RECONCILIATION

In an old rhythm and blues song, the lyric chides a less than faithful lover with the message: "I may not be the one you want, but I sure am the one you need." In our romantic infatuation with racial balance-type remedies, we have over the years not sought suggestions from black teachers regarding school desegregation for fear it might take the form of self-serving testimony designed to protect their jobs rather than advance the schooling needs of our children.

It turns out that black teachers might have been interested in doing both. As Dr. Du Bois warned, the desegregation process did destroy the careers of uncounted thousands of black teachers and principals. Only the pursuit of school integration as something akin to a romantic object could have blinded us to the fact that court decisions do not of their own effect equal educational opportunity. School desegregation processes carried out so as to permit school boards to discharge black teachers and humble black administrators who were invariably reduced to assistant status, often with no real duties, represented no achievement for either we who "won" such cases, nor for the black children we were trying to serve.

³¹Bell, *Shades of Brown*, p. 124.

³²*Ibid.*

But in the early days, we were distrustful of black teachers who did not wholeheartedly endorse school integration. That distrust remains today as is evident by the fact that both the media and the courts have seemed more ready than civil rights agencies to recognize the potential educational value of all-black schools when these schools are freed of the fiscal and psychological burdens of enforced segregation.

The Supreme Court has given its blessing to school desegregation plans that emphasize policies intended to improve the quality of education even when those policies reduce the potential racial balancing of the schools. In the Detroit school case, the plaintiffs, after failing to obtain an interdistrict metropolitan remedy in the 70 percent black school system,³³ urged that the city's schools be fully integrated. The district court approved instead a plan giving priority to educational reform.³⁴

In approving the Detroit plan that had the support of much of the black community as well as the predominantly black Detroit school board, Chief Justice Burger rejected contentions that the constitutional violation was the unlawful segregation of students on the basis of race, and therefore the Court's decree must be limited to remedying unlawful pupil assignments. He explained that the specific educational remedies, normally the province of the school board, were necessary "to restore the victims of discriminatory conduct to the position they would have enjoyed in terms of education had these four components been provided in a nondiscriminatory manner in a school system free from pervasive de jure racial segregation."³⁵

Earlier, lower courts had given indications that they were willing to approve desegregation plans giving priority to educational improvement over racial balance. In the early 1970s, local black attorneys in Atlanta worked out a settlement of the school desegregation case that called for full faculty and employee desegregation but only limited pupil desegregation. In exchange the school board promised to hire a number of blacks in top administrative positions, including a black superintendent of schools.³⁶ National civil rights groups opposed the settlement, but in approving the plan the court of appeals noted that blacks occupied a majority of school board posts, two-thirds of the school administration and staff posts, and over 60 percent of the faculty positions. In addition, "the numerous

nonappealing black plaintiffs who agree and support the present plan attest the district's lack of discrimination against black students as well as its freedom from the effects of past race-based practices."³⁷

A potentially valuable legal precedent that has received far less attention than it deserves is *Tasby v. Wright*, a 1981 district court decision in the Dallas school desegregation litigation.³⁸ Despite litigation stretching back to 1955, the court found "vestiges of state-imposed racial segregation remain. . . . (adding) that additional systemwide transportation is not a feasible remedy for the existing constitutional violation."³⁹

Under earlier desegregation plans, the large and increasingly Mexican-American and black school system was divided into six sub-districts, two of which were predominantly minority. Demographic conditions tended to support the school board contentions that the two minority districts, one 82 percent Mexican-American and the other 98 percent black, could not be desegregated on the racial balance model. In refusing to alter the sub-district arrangement, the court noted that the opposition of many black parents to any transportation out of the black district was based on their fear that it would adversely affect the quality of schooling and result in a loss of parental involvement and community support for the schools.⁴⁰

The court also noted that the educational program in the all-black district based on the assumption that minority children can learn, even in a primarily minority setting, had been praised and emulated by leading educational authorities around the country. The sub-district, under the leadership of Dr. Yvonne Ewell, a noted black educator, has experienced a steady rise in student achievement levels. Indeed, the court found it had increased as much or more than minority achievement in the sub-districts of the system that had been racially balanced.⁴¹

Without litigation, local black groups in Portland, Oregon and Milwaukee, Wisconsin, have successfully opposed racial balance plans in favor of policies intended to improve the quality of schooling in black communities. And in Philadelphia, a new, black school superintendent, Constance Clayton, has sought a delay in a court-ordered desegregation plan in order to revise its provisions and place the thrust of the plan on education rather than transporta-

³⁷*Calhoun v. Cook*, 487 F.2d 680, 719 (5th Cir. 1973). The court held to this view on subsequent appeals. See, 522 F.2d 717 (5th Cir. 1975); 525 F.2d 1203 (5th Cir. 1975).

tion.⁴² She hopes to implement programs to increase the achievement of students at predominantly black schools which would eliminate the need to pair those schools with predominantly white schools for desegregation purposes.⁴³

Educators and social scientists are now involved in compiling the instances of success and analyzing the growing number of studies of effective schools in ghetto areas.⁴⁴ Much of this literature has grown out of the disenchantment with racial balance remedies as the definitive means of desegregating schools, particularly in large urban areas that are all-black. Additionally, the new studies are a response to the widely-held view that education cannot compensate for social status or family background.⁴⁵

Whatever was the situation in 1955, when civil rights lawyers and courts began the long road toward compliance with the *Brown* decision, there is now plenty of evidence that all-black schools can effectively educate those who attend them. There are millions of minority children attending all-minority schools in urban areas so dense that desegregation by the racial balance model is both a political and demographic impossibility. And, as indicated here, courts are more than willing to consider alternative means of providing "equal education opportunity."

In short, the time is ripe for the successors to Robert L. Carter to adopt the educationally-oriented school desegregation strategy now that in hindsight he wishes he had placed in effect in 1955.

The Implementation of Desegregation Plans Since Brown

William M. Gordon, *Wright State University*

INTRODUCTION

When the Supreme Court overturned the doctrine of "separate but equal" in *Brown v. Board of Education of Topeka, Kansas (Brown I)* (1954) as a violation of the Equal Protection Clause of the 14th Amendment, it fashioned a decision with no immediate relief. The question of relief was set for reargument, and an invitation to submit briefs to aid in the formulation of relief was extended to the attorneys general of the United States and the states where de jure school segregation was imposed. Although the reargument was held a year later in *Brown II* (1955), the Court still failed to provide clear guidelines to end de jure segregation in public schools. Instead, it required only "a prompt and reasonable start toward full compliance" (p. 300). Thus, whether a Black student could be admitted to a formerly all-White school or vice versa constituted desegregation was left unanswered. The Court provided no definitions of desegregation and no guidance regarding how it was to be accomplished.

The issue was further confounded by the Court's now-famous admonishment to the states to use "all deliberate speed" in implementing the mandates of *Brown II* (p. 301). This phrase soon took on the mantle of black humor: Blacks, it was noted, wanted "speed," while Whites wanted to be "deliberate." *Brown II*, with its high-sounding phrases founded on the notion that school systems would make good-faith efforts to comply with the mandates of *Brown I*, became more a symbol of victory than a definitive statement or direction for remedy.

Following *Brown II*, the White community, with few guidelines from the courts, moved deliberately. As would be expected, little desegregation happened. Still, even though little was happening and even less planning was being done, some progress was made. Amidst a flurry of state laws obstructing desegregation, political posturing by elected officials, retaliation against civil rights lawyers, and open defiance by local citizen groups, most of the southern states previously operating under de jure segregation took some affirmative actions.

One of the early tests of *Brown* arose in Little Rock, Arkansas, where a desegregation plan formulated by local school authorities was opposed by the state legislature and by the governor, who called in the National Guard to prevent Black students from attending a formerly all-White high school. The governor's actions were enjoined by the federal district court. Subsequently, in *Cooper v. Aaron* (1958), the Supreme Court unanimously

held that the desegregation in Little Rock was to proceed and that *Brown* could not be overcome by state legislative actions. However, like *Brown*, *Cooper* provided no guidelines as to what constituted a desegregated school. Hence, many districts proceeded with the notion that accepting a few assigned or voluntary Black student transfers into formerly all-White schools satisfied the requirements of *Brown*.

As the years following *Brown* passed with little appreciable change in the racial makeup of the former de jure school systems, the Court became impatient. In *McNeese v. Board of Education for Community Unit School District 187, Chaokia, Illinois* (1963), the Court held that it was not necessary to exhaust administrative remedies in school desegregation cases before relief could be sought in a federal court. *McNeese* was quickly followed by *Griffin v. Prince Edward County Board of Education* (1964), in which the Court held that “the time for mere ‘deliberate speed’ had run out” (p. 234). Despite these stern words, however, little significant desegregation occurred.

FREEDOM OF CHOICE

Little was accomplished in the initial desegregation efforts following *Brown* because no clear judicial guidelines were set forth. While a few districts attempted to desegregate by “allowing” a handful of Blacks to attend formerly all-White schools on a voluntary basis, no efforts were made to assign or entice White children to attend formerly all-Black schools.

Among the earliest desegregation strategies were the so-called freedom of choice plans. Basically, these plans involved expanding attendance zones to include both Black and White schools. Each child was provided with the opportunity to select the school of his or her choice within the expanded zone. Freedom of choice plans had a ring of democracy because they allegedly gave families a choice of schools for their children. Generally, however, there were several caveats. First, in most instances the children living closest to a school had first choice to attend it. Second, children were assigned to their second or third choices as schools reached some arbitrarily determined building capacity. Third, and most important, school guidance personnel exercised substantial influence over the selection process. Thus, with freedom of choice, school authorities continued to control most, if not all, pupil assignments, and, in most cases, made little pretext that it was their desire to have the schools remain unchanged. As a result, former Black schools remained all-Black and former White schools gained a few selected Black students.

The first real test of freedom of choice involving a contest between “desegregation experts” and school authorities occurred in a Virginia case, *Green v. County School Board of New Kent County* (1968). In *Green*, the school board had set up a freedom of choice plan that allowed students in the county to select between two racially segregated K–12 schools. However, after the plan was implemented, no White children attended the formerly all-Black school, and only 15% of Black children were enrolled in the formerly all-White school. Testimony in the case revealed that the

county's Black students were "counseled" out of choosing the White school, while school and community pressures guaranteed that no White families would send their children to the Black school.

In *Green*, the Supreme Court laid down important guidelines that had significant influence upon desegregation plans. It stated that it was no longer satisfied with state neutrality and, quoting from *Griffin*, once again stated that "the time for 'deliberate speed' has run out" (p. 438). Additionally, the Court charged state school officials "with the affirmative duty to take whatever steps might be necessary to convert to a unitary school system in which racial discrimination would be eliminated, root and branch" (p. 438). This meant that local authorities were held accountable not only for their affirmative acts but also for their acts of omission. The Court also noted its dissatisfaction with freedom of choice plans that had not eliminated racially identifiable schools. Finally, it held that freedom of choice may be allowed to prove itself, but maintained that "if there are reasonably available other ways, promising speedier and more effective conversion to a unitary, nonracial school system, freedom of choice plans must be held unacceptable" (p. 441).

Following *Green*, plaintiff groups were able to present more clearly their demands, and the courts were better able to establish guidelines. Along with the implementation of the legal principals established in *Green*, the use of mathematical formulas in plan development and analysis began. As directed by the district court and affirmed by the circuit court, a mathematical definition of plus or minus 15% for racial identifiability was developed. That is, henceforth, a school would be judged to be desegregated if the racial ratio of its student body was within 15% of the overall student population of the district. This standard yielded a definitive measure for desegregation planners and the courts as various plans to satisfy *Brown* were advanced by school systems and plaintiffs alike.

Green's progeny addressed the refinements of freedom of choice. For example, in *Bradley v. Board of Public Instruction of Pinellas County, Florida* (1970), the Fifth Circuit disallowed a plan based upon majority-to-minority transfer, in which the voluntary transfer of the student improves the racial balance of both the sending and receiving school. The court did not rule the plan out, but held that it could not be used if it did not work. In a Michigan case, *Davis v. School District of the City of Pontiac* (1971), the Sixth Circuit ruled that when the only alternative to freedom of choice proposed by the school board was no more than the reaffirmation of existing policy, the adoption of a compromise plan by the District Court was not an abuse of its discretion.

Since *Green*, the courts have been very clear regarding the place of freedom of choice in school desegregation. They have noted that this approach has previously served White parents in their efforts to avoid sending their children to desegregated or formerly Black schools, and have maintained that freedom of choice plans are acceptable only if they are effective in promoting desegregation. Prior to the development of magnet schools there was little educational excuse for freedom of choice, and where such justification was manufactured, it was easily defeated in the courts. Thus, the only component of freedom of choice that remains in use today is majority-to-minority transfer.

STUDENT ASSIGNMENT PLANS

Following *Green*, the science of student assignment evolved through the efforts of desegregation consultants. Plans based on assignments utilizing attendance area redistricting, pairing and clustering attendance zones, and restructuring grade configurations within buildings were developed in several southern states. Almost overnight, by state law, most of Florida's large, countywide school districts were involved in designing desegregation plans. Georgia, Alabama, and Mississippi—which were divided into the more traditional city, town, and rural school units that called for less extreme reassignment plans—simply assigned White students to formerly all-Black schools, and vice versa, within these smaller geographic areas. These areas were so compact that in a substantial number of instances, student assignments were from the same neighborhoods and there were many instances where the former Black and White schools actually shared common playgrounds. Additionally, small district plans in these states provided value beyond desegregation because they eliminated the expense of program, equipment, and course duplication found separately in the former White and Black schools.

The desegregation plans used in larger, formerly *de jure* southern school systems, communities, although involving more students, were not complicated. Attendance areas were redrawn or separate zones were paired or clustered and students were assigned to them by race. Where distances were too great for students to walk to school conveniently, the provision of transportation, generally busing, to facilitate school desegregation was ordered.

Even though transportation involved less than 10% of the nation's school children, a hue and cry of resistance to it developed. The political institutionalization of the term "busing" came about in *Cisneros v. Corpus Christi Independent School District* (1970). When the school board and White parents in this Texas community put forth their case by describing the dire effects that would result from the transportation of students to achieve desegregation, a federal trial court judge rejected their arguments, drawing the following conclusion:

... the children who are being bused now make no such claims, nor have I seen showing of any harmful effects on the individual children that will outweigh the harmful effects on the Negro or Mexican-American child who is in a segregated dual system. ... The physical and social inconveniences that some children might suffer will not be so severe or so prolonged when compared to the psychological and emotional trauma, and scarring, and crippling that minority children suffer when they feel that they are rejected and not accepted. (pp. 623–624).

This decision did not go unnoticed. In a televised speech following the decision in the Corpus Christi case, then-President Richard Nixon cited that district's busing plan as an example of unconscionable social engineering. Thus, *Cisneros* spawned an era in which busing became synonymous with school desegregation.

The showdown on busing occurred in *Swann v. Charlotte-Mecklenburg Board of Education* (1971). In *Swann*, the Supreme Court held:

... we find no basis for holding that the local school authorities may not be required to employ bus transportation as one tool of school desegregation. Desegregation plans cannot be limited to the walk-in school. (p. 30)

The Court also established the caveat that the distance of travel could not be so great as to risk the health and safety of children. Thus stated, it let stand the busing of 23,600 pupils in this North Carolina community an average of 15 miles one way requiring over an hour of busing.

In a case originating in Mississippi, *Singleton v. Jackson Municipal Separate School District* (1969), the Fifth Circuit provided a laundry list of desegregation dictates while addressing specifically the desegregation of school staff and faculty. The court reviewed the demotions and dismissals of Black educators in the newly desegregated Jackson School District, holding that a desegregated faculty must be assigned, promoted, paid, and demoted without regard to race. Further, it maintained that any reduction in professional staff must be based on objective and reasonable nondiscriminatory standards, and that no staff vacancies could be filled through recruitment of any person of a race, color, or national origin different from that of the individual dismissed or demoted.

The school board in *Singleton* was directed to develop nonracial, objective criteria when identifying staff members who were to be dismissed or demoted. Regarding students, the Fifth Circuit addressed and permitted a majority-to-minority transfer in the Jackson school district, but only after racially desegregated pupil assignments had occurred. It also directed that schools and classrooms had to be desegregated and reorganized the district's busing plan to offer nondiscriminatory transportation to all qualified students. Finally, all school construction, site selection, and location of temporary classrooms had to meet with the approval of the court in order to prevent the recurrence of a dual school system.

Most importantly, the mandate of immediate desegregation and the creation of unitary systems formulated in *Green* was effectively restated in *Singleton*. The court allowed the district no time to waste on the development of complex, exotic programs or ploys so that business as usual could continue. The plan was ordered in January 1970 and ordered implemented by September 1970.

Following closely on the heels of *Singleton* was *Spangler v. Pasadena City Board of Education* (1970), wherein a federal court in California held that school authorities were obligated under the provisions of the 14th Amendment to make an equitable distribution of teachers and administrators according to experience and advanced training. The system was found to have violated the Equal Protection Clause when it assigned teachers with less experience and training to schools with predominantly Black enrollments. The court further ruled that requiring students from two Black residential areas to be transported to White schools in order to achieve desegregation while not simultaneously requiring White children to be bused into Black areas placed an undue share of the burden on the Black children. *Spangler* is significant because, for the first time, a court addressed the need to balance teachers' experience and credentials in addition to race. It also established the notion of equity so that the burden of the desegregation would not fall upon one race.

The next round of cases gave greater definition to these standards. In *Davis v. Board of School Commissioners of Mobile County* (1971), the Supreme Court held that the proposed division of an Alabama school district into two parts, each with different desegregation ratios, was unlawful. The

Court reached this conclusion even though the community was naturally divided by a north–south highway. In *Johnson v. San Francisco Unified School District* (1971), a district court held that desegregation was to provide maximum benefits that could not be achieved by the mere meeting of arithmetical percentages on racial balance; the experience and qualifications of teachers as well as the size of classes were also important considerations. The following year, *Wright v. Council of the City of Emporia* (1972) was decided. In this case, the Supreme Court held that a city could not withdraw from a county school system. The test in permitting withdrawal would be to determine whether withdrawal hindered or furthered the process of school desegregation.

DE FACTO SEGREGATED SCHOOL SYSTEMS

The Supreme Court did not address de facto segregation until it was presented with *Keyes v. School District No. 1, Denver, Colorado* (1973). In that case, it found that Denver school authorities had intentionally maintained a segregated system in which a pocket of schools in an area populated mostly by Blacks and Hispanics was educationally inferior to the predominantly White schools in other parts of the city. Accordingly, the Court allowed for the effectuation of a systemwide remedy with a showing of intentional segregation in only a substantial portion of the district. Many legal scholars and attorneys have questioned this “allness” premise of *Keyes* on the doctrinal basis that the scope of the remedy should not exceed the scope of the violation—that is, if only a portion of the district is segregated, only this portion need be desegregated. Following *Keyes*, the first real attempt to confine a remedy to a portion of a school system was made in an Ohio case, *Dayton Board of Education v. Brinkman* (*Dayton I*) (1977). In its ruling, the Supreme Court stated the following: “Once a constitutional violation is found, a Federal Court is required to tailor ‘the scope of the remedy’ to fit the nature and extent of the constitutional violation” (p. 420). It then added: “. . . only if there has been a systemwide impact may there be a systemwide remedy” (p. 420). On remand, the trial court in *Dayton I* was given time to come to grips with the meaning of the terms “cumulative violation” and “incremental segregative effect,” which had been used by the Supreme Court in its opinion. The district court was to leave the plan it had ordered in effect until a new plan could be fashioned that complied with *Dayton I*.

With the plan temporarily in effect in the city of Dayton and with the district court slightly bewildered by the directions given it by the Supreme Court, school authorities appealed once again. In 1979, the Court heard two Ohio cases simultaneously, *Dayton II* and *Columbus Board of Education v. Pennick*. In both instances, the district courts had held that the segregative effect was districtwide, and therefore a districtwide plan was appropriate. Although the Court did not overrule *Dayton I*, Justice White’s remarkably logical opinion certainly rewrote it and reaffirmed the acceptability of a systemwide remedy in instances where segregative intent had been established. Chief Justice William Rehnquist, the author of *Dayton I*, dissented strongly in both *Pennick* and *Dayton II*. Writing in his dissenting opinion in *Pennick*, he stated:

I could not subscribe to the affirmative duty, the foreseeability test, the cavalier treatment of causality, and the false hope of *Keyes* and *Swann* rebuttal in Columbus, I cannot subscribe to them here. Little would be gained by another 'blow-by-blow' recitation in dissent of how the Court's cascade of presumptions in this case sweeps away the distinction between de facto and de jure segregation. (p. 542).

However, as White pointed out, the district court had repeatedly emphasized that it had found purposeful segregative practices with current systemwide impact. These practices satisfied *Keyes* while blunting the incremental effect requirements of *Dayton I*. White noted that *Pennick* was:

... not a misuse of *Keyes*, where we held that purposeful discrimination in a substantial part of a school system furnishes a sufficient basis for an inferential finding of a systemwide discriminatory intent ... and that given the purpose to operate a dual school system one can infer a connection between such a purpose and racial segregation in other parts of the school system. ... The Court of Appeals was also quite justified in utilizing the Board's total failure to fulfill its affirmative duty—and indeed its conduct resulting in increased segregation—to trace the current, systemwide segregation back to the purposefully dual system of the 1950's and to the subsequent acts of intentional discrimination. (p. 541)

Thus, whereas *Brown* eliminated de jure segregation, *Keyes* addressed de facto segregation and established the availability of a systemwide remedy. *Keyes* closed the ring in terms of a basis for liability in school desegregation. Following *Keyes* but prior to *Dayton II* and *Pennick*, it became clear to most Americans that school desegregation was going to occur both in the North and the South as well as in urban, suburban, and rural districts. This realization spawned a series of lawsuits built upon creative interpretations of the Supreme Court's mandates.

For example, in *Morgan v. Hennigan* (1974), District Court Judge Arthur Garrity came to the forefront in the first of a series of decisions involving the Boston public schools. In this case, Garrity found the school authorities had knowingly and intentionally maintained a dual system that affected all of the city's students, teachers, and school facilities. Additionally, he found that while the Boston school board and its commissioner were not responsible for the maintenance of the dual system, they would be retained as parties for the purpose of remedial relief. In a subsequent case, *Morgan v. Kerrigan* (1975), Garrity ordered a desegregation plan involving the creation of community districts and citywide magnet schools in addition to the normal redistricting, pairing, and clustering of schools. In response to a vocal and at times violent reactions to his orders, he stated that the presence of racial hostility is not the applicable standard in determining whether the maintenance of a dual school system is unconstitutional. Identifiably one-race schools inflicted two sorts of injury upon minority students, Garrity noted. The first injury was the effrontery likely to be felt from racial or ethnic isolation; the second was the effect on minority-group students of being cut off from the majority culture upon which success in society is determined.

Garrity's plan met with significant resistance that eventually turned into violence. South Boston High School suffered several fires and was the site of numerous fights, intimidations, and acts of vandalism. Significant disruptions occurred at other schools and throughout the community. The Boston School Committee, absolving itself from any connection with the desegregation plan, blamed Judge Garrity for the violence. The school district quickly deteriorated and its administration became chaotic. Conse-

quently, Garrity took over the school system, appointing his own administration and enjoining the Committee from actively directing the system. The conflict was eventually resolved, but strong feelings of racial animosity were generated throughout Boston as a result.

A similar set of circumstances occurred in Cleveland, Ohio. In *Reed v. Rhodes* (1976), District Court Judge Battisti found that the Cleveland school district was segregated. He further held that the construction of quality neighborhood schools in response to the overcrowded conditions that plagued many of the city's identifiably Black schools could not be viewed as a defense for the operation of a dual system because the new schools exacerbated the isolation and identification of facilities by race. When, as in Boston, the desegregation order was met with violence, the court took over the operation of the schools, removing some school officials, enjoining the board, and appointing its own administrators.

Not all school systems reacted violently to desegregation orders, even though there was a significant amount of litigation after *Keyes*. For example, there was a noticeable absence of violence in the aftermath of *Higgins v. Board of Education of the City of Grand Rapids, Michigan* (1973). In this case, the trial court ordered an end to that city school board's practice of consistently assigning Black administrators and teachers to predominantly Black schools, which it determined were the product of a contrived set of neighborhoods whose boundaries were determined in large part by the racially defined housing patterns.

In a case addressing the segregation of Hispanic students, the Fifth Circuit found in *Morales v. Shannon* (1975) that the San Antonio, Texas, school district had established and maintained since 1907 a facility known as "the Mexican School." Subsequently, two similar elementary schools had been established, and the district had implemented a freedom of choice plan superimposed over a "proximity to school" assignment system in which nearness of residence took precedence. The court ordered an end to this system because it effectively "froze" Mexican American students into the three identifiably segregated schools. In a second Texas case, *United States v. Texas Education Agency* (1976), the Austin Independent School District was found to be operating a school system that discriminated against Blacks and Hispanics. The same court applied a tort theory, maintaining that individuals intend the natural and foreseeable consequences of their actions. Thus, it held that the assignment of students to schools closest to their homes in a city with clearly defined segregated housing patterns established a prima facie case of de facto segregation.

In *National Association for the Advancement of Colored People v. Lansing Board of Education* (1977), the Sixth Circuit reaffirmed a test for purposeful segregation by public officials and held that a finding of de facto segregation would be upheld when it was apparent that authorities carried out a systematic program of school segregation. The court further ruled that segregative intent can be inferred when, as was done in this Michigan city, school authorities implement and command special transfer policies and one-way busing so that Black children are transported out of their neighborhoods into White schools without a reciprocal transfer of White students.

The effect of these decisions was a flurry of litigation. As the ensuing decisions came down, White parents in the nation's cities moved to the

safe havens of the suburbs, thereby removing their children from the increasingly integrated urban public schools. Whites remaining in urban areas found themselves in districts in which they were the minority. The loss of the White population, and its accompanying leadership and economic base, led to concerns that the urban schools would become dumping grounds for poor and disenfranchised students. Conversely, the emerging suburban communities were viewed as profiting unfairly and as having been allowed to remain above the realities of the deprivation that, if not a direct result of the suburban development, was certainly an outgrowth of it. With this in mind, plaintiff groups began to look toward the greater metropolitan areas as sources for relief from the vestiges of segregation.

METROPOLITAN REMEDIES

As early as 1970, it became apparent that segregated urban districts would lose a portion of their White populations to suburban areas and private schools when desegregation plans were implemented. Where these occurrences appeared to be a real possibility, plaintiff groups sought metropolitan or interdistrict relief. This meant that plaintiffs asked the courts to go beyond the boundaries of the districts and incorporate those students who resided in separate, contiguous school systems into metropolitan desegregation plans. Previously, most school officials had drawn attendance areas following municipal or racial boundaries. However, when court-ordered school desegregation plans were implemented, attendance zones were no longer coterminous with municipal boundaries; instead, they involved entire counties as a single unit. This minimized the impact of population movement and sent the message that there was nowhere to go to escape desegregation.

Two cases are illustrative: *Spangler and Hobson v. Hanson* (1971) addressed problems associated with desegregating large metropolitan school districts in California and Washington, D.C., respectively. Both cases involved areas in which a large Black urban population was surrounded by a large White suburban community, yet the courts refused to go beyond municipal boundaries to include the suburban areas in the remedy plans. The real push for metropolitan remedies occurred in two later suits occurring at about the same time: *Milliken v. Bradley* (1974) and *Newburg Area Council v. Board of Education of Jefferson County, Kentucky* (1974).

Milliken and *Newburg* followed uniquely different courses; one eventually led to an interdistrict remedy. In the more famous of the two, the Detroit, Michigan *Milliken* case, the Supreme Court denied interdistrict relief even though most of the suburban schools had not been parties to the lawsuit and no claim had been made that they had committed any constitutional violations. The Court held in *Milliken* that an interdistrict remedy cannot be imposed absent unconstitutional, racially discriminatory acts by individual districts causing interdistrict segregation or the deliberate drawing of district lines on the basis of race. It maintained that an interdistrict remedy might seriously disrupt the structure of public education in Michigan and give rise to problems associated with large-scale busing as well as school finance and administration.

The *Newburg* litigation became an issue between the school districts of the city of Louisville, Kentucky, and surrounding Jefferson County. The Louisville school board supported consolidation of the districts for several reasons, one being desegregation. Jefferson County school officials, on the other hand, opposed such a move. Louisville had the vast majority of the Black population; Jefferson County contained almost two-thirds of the area's White population. By 1971, almost three-fourths of Louisville's schools were racially identifiable, with enrollments of almost 50% Black. The Black enrollment was increasing each year, primarily because the White enrollment was falling rapidly as Whites fled the city for the suburbs. In distinguishing *Milliken* from *Newburg*, the lower court found that "school district lines in Kentucky have been ignored in the past for the purposes of aiding and implementing continued segregation" and ordered the districts to combine (p. 1360). Instead of following the usual appeal procedures when the Supreme Court refused to hear an appeal, the Louisville district, operating under state law, voted itself out of existence. This automatically transferred responsibility for the city's schools to the county system, and the need for a metropolitan remedy became a reality.

Following *Milliken* and *Newburg*, the courts were disinclined to consider additional metropolitan remedies. In *Tasby v. Estes* (1975), the Fifth Circuit refused to even address a metropolitan remedy for the Dallas, Texas, schools. The same was true when the issue was raised in Boston, Dayton, Columbus, and Birmingham.

A significant omission in the early decisions involving interdistrict segregation was the failure to find intent on the part of the state or the school district to cause interdistrict segregation. In *United States v. Board of School Commissioners of the City of Indianapolis, Indiana* (1976), the lower courts refused to issue an order consolidating the Marion County school districts because intent was not found. However, the Supreme Court vacated and remanded Indianapolis in light of the decisions in *Village of Arlington Heights v. Metropolitan Housing Development Corporation* (1977) and *Mayor of Washington, D.C. v. Davis* (1976), in which the decisions had been based upon the requirement of a racially discriminatory intent or purpose in order to establish a constitutional violation.

Prior to the *Indianapolis* case, the significant element in the metropolitan remedies had not been intent. Rather, it had been the need to establish prior de jure segregation. In these earlier decisions, the Court had emphasized that the state and local officials had an affirmative duty to bar further discrimination and to remove all vestiges of past discrimination. Thus, in *Indianapolis*, *Arlington Heights*, and *Mayor of Washington, D.C. v. Davis*, the courts appeared to be saying that past de jure segregation provided sufficient intent to commit an interdistrict violation where segregative effects were found.

The key in all metropolitan remedies remained *Milliken*, which stood for the proposition that where no interdistrict segregative intent resulting from a constitutional violation could be found, an interdistrict remedy was impermissible. Some significant cause-effect relationship, either previous or ongoing, had to exist between the school districts in order to warrant an interdistrict relief. However, where school systems exchanged

or allowed cross-district student enrollments for segregative purposes or with segregative results, an interdistrict remedy was warranted. For example, in *Evans v. Buchanan* (1976), a federal trial court found that after 1954—that is, post-*Brown*—the Wilmington, Delaware school board had allowed White students optional attendance zones outside of their residential areas. Additionally, it found that the state had promoted segregation since 1973 by subsidizing interdistrict transportation of its public school students, 94% of whom were White, to private and parochial schools. These practices met the standard of intent and an interdistrict remedy was ordered.

The deliberate drawing of district lines to conform to racial residential patterns was also sufficient to infer intent and purposeful discrimination. Not all courts were willing to acknowledge residential patterns as a basis for interdistrict relief, however. For example, in *School District of Kansas City, Missouri v. State* (1978), the Court held that although there were segregative conditions throughout the entire metropolitan area of Kansas City, the intentional acts or omissions of the city and state as well as the districts could not justify a claim for interdistrict relief. Later, in a surprising decision in *Taylor v. Ouachita Parish School Board* (1981), the trial court held that although more than 2,000 White students residing in Monroe, Louisiana, attended schools outside the city in Ouachita Parish, there was no demonstration of segregative intent under *Milliken*. The court subsequently refused to mandate interdistrict relief, but it did order the parish's students reassigned to the Monroe City schools and ordered a building owned and operated by the Ouachita Parish School Board transferred to the Monroe City School District. In addition, it ordered the overlapping attendance zones and interdistrict options for activities to be discontinued.

CONCLUSION

The implementation of desegregation remedies has had an inconsistent history. For many years, the nation's courts operated without a reliable definition of what constituted a desegregated school or district. Once the Supreme Court went beyond de jure segregation and included districts with de facto segregation, the issue became the proper extent of the remedy. The incremental effect standard of *Dayton I* confused the planning in metropolitan areas by requiring the almost impossible task of showing liability for each individual school in a district. This standard was significantly restructured with *Dayton II* and *Pennick*.

Throughout the history of desegregation planning, the courts have supported the redrawing of attendance boundaries, the pairing and clustering of attendance areas, and the provision of transportation to ameliorate school segregation, where necessary. Ironically, the political sloganeering that has accompanied the latter remedy and partisan cries for "quality education" and "neighborhood schools" have historically occurred within communities only after desegregation became an issue, not before.

Prior to the 1980s, U.S. courts had a tendency to ignore political pressures and order plans utilizing accepted desegregation techniques. More

recently, the courts have looked to less volatile remedies. These latter-day plans have focused upon volunteerism and magnet programs, accompanied by substantial amounts of federal funds, primarily in urban areas where Black populations exceed 50% of a district's student population. Despite the significant federal funding of these programs, which have, in some instances, played a role in the improvement of educational outcomes, they have had only modest impact upon desegregation.

The metropolitan solution is a concept whose time has not yet arrived. Although much economic, social, and educational logic exists to support metropolitan remedies that unite communities that are economically tied to one another, neither the political will nor the inclination of the courts to embrace such solutions are present. The metropolitan remedy apparently will occur only after urban school districts have turned completely minority and have ceased to be viable. At that point, however, the apparent economic consequences of dysfunctional, racially isolated, urban communities and school districts could become so severe in terms of the deterioration of urban infrastructures, economic deprivation, crime, and concomitant social problems, that the metropolitan remedy will be the only feasible solution to public education, let alone the issues of racial isolation.

The plans that are in effect in most middle-sized to small U.S. communities are, for the most part, working. It is the larger metropolitan sprawls, where over 80% of the public school children now attend school, that still have severe problems of racial isolation. The plans that have worked in the past may no longer be viable. The plans of the future require realistic magnets, mandatory assignments to interdistrict schools, educational parks, specialty schools operated on a regional basis, and other approaches that manifest serious attempts by public officials to address the issues and root causes of racism in the United States.

Fifty Years After Brown: The Benefits and Tradeoffs for African American Educators and Students

James E. Lyons **University of North Carolina, Charlotte**
Joanne Chesley **University of North Carolina at Greensboro**

This article examines the benefits and tradeoffs for African American professional educators and students that resulted from the profound Brown v. Board of Education decision. It addresses the impact of the Brown decision immediately after it was rendered for African American educators and students and the legacy of Brown for both of these groups during the previous 50th years. The article also presents the findings from a study of 36 current and recently retired African American high school principals in North Carolina and Alabama to determine their perceptions of the legacy of the Brown decision for both African American educators and high school students. Additionally, the article presents the views of a small sample of these principals who were interviewed regarding the degree to which African American high school students are currently involved in student leadership roles and school activities. Results of the study indicated that the vast majority of the respondents believed that Brown had benefited both African American educators and students; however, they indicated that it had some unintended consequences such as a precipitous drop in the number of African American teachers to serve as role models, competent professionals, and authority figures for students—both Black and White. Furthermore, they perceive that, particularly in integrated high schools where White students are in the majority, the curriculum usually does not adequately address the history, contributions, culture, and experiences of African Americans. Moreover, the principals perceive that African American students in fully integrated schools, with few exceptions, are underrepresented in school leadership roles and are often reluctant to run for elective leadership positions because they usually do not believe they can win.

INTRODUCTION

On May 17, 1954, at 12:52 p.m., the United States Supreme Court rendered its momentous decision in the case of *Brown v. Board of Education of Topeka, Kansas* (1954). The fundamental public policy that the court unanimously ruled upon was straightforward: segregated schools (established and maintained by state action) were inherently unequal. The court clearly said, through its ruling, that separate but equal was, in fact, a contradiction in terms—official state sanctioned segregation was a violation of the equal protection clause of the 14th Amendment of the Constitution, which forbids any state from making or enforcing any laws which deny any person within its jurisdiction the equal protection of the laws.

Prior to the Supreme Court's ruling, dual and segregated school systems had been established and maintained for African American and White students. These schools systems were primarily in the southern states where Jim Crow laws had prevailed after reconstruction. Ironically, the rationale for establishing and maintaining *de jure* segregated schools had been also formalized by the United States Supreme Court in another momentous decision, *Plessy v. Ferguson*, in 1896, which legitimized the principle of "separate but equal" (1896). The case evolved from a suit filed by Homer Plessy, a Black man who had filed suit after he had initially been fined for sitting in the White section of a railroad car in Louisiana. His case questioned the constitutionality of an act of the General Assembly of the State of Louisiana, passed in 1890, providing for separate railway

carriages for the White and colored races. Plessy contested the decision all the way to the United States Supreme Court, which upheld the state's separate but equal doctrine.

In the *Plessy* decision, the Supreme Court gave racial inequality and segregation an air of legitimacy for over a half century. Moreover, it served to institutionalize racial segregation and social norms, particularly in the South, in both public and private arenas. Not only did the decision condone and maintain racially separate railroad cars and other modes of public transportation, it virtually assured segregation in schools and school activities, courthouses, waiting rooms, public beaches, swimming pools, restaurants, bathrooms and drinking fountains.

Although the Supreme Court ostensibly ruled in 1896 that public accommodations and facilities were to be separate but equal, history has shown that this seldom reflected reality, particularly in those states in which the court decision was most applicable. For example, Charles Houston noted civil rights attorney and former Dean of the Law School at Howard University went to South Carolina in 1935 and filmed the deplorable conditions in Black schools. He found that many of them were no more than unheated cabins and tar paper shacks (Lardner, 1999). Yet, in theory, under the separate but equal doctrine they were supposed to be equal to White schools in the state.

Although the *Brown* decision eventually proved to be a major factor in America for granting civil and equal rights to those who had long been denied them, initially very little happened after the ruling was handed down. It was business as usual in the schools throughout the South. Some scholars contend that the Court intentionally left it very vague and open as to how and when things would change because the Court was very divided over how to fashion a remedy to integrate the schools (Orfield & Eaton, 1996). Some justices of the Court wanted immediate compliance, others wanted it done one grade at the time, and others wanted it left totally to the targeted states to decide when and how to do it. Some legal scholars have noted that this was the best that Chief Justice Earl Warren could get from his colleagues of the Court since he wanted to present a unanimous vote to the nation (Fowler, 2000). Recognizing its dilemma during the first year after the original *Brown* decision had been handed, the Supreme Court came back in 1955 and passed *Brown II* (1955), which stated that segregated schools had to be dismantled with "all deliberate speed." Yet, again, the Court failed to order specific guidelines and a timeframe for schools to be desegregated. As a consequence, most southern states did little, if anything, except pursue covert and overt strategies to resist the Supreme Court's order (Campbell, Cunningham, Nystrand, & Usdan, 1985). Resistance was so strong in Prince Edward County, Virginia, that officials elected to close the public schools for five years rather than to integrate them (Smith, 1965). One of the most notorious acts of defiance of the court's order occurred in Little Rock, Arkansas when President Eisenhower had to send federal troops to the capital city to literally escort nine Black students to and from Central High School because the state, with active resistance of Governor Orval Faubus, would not enforce the desegregation order. Orfield and colleagues (1966) noted that resistance to dismantling segregated schools was so strong in the southern states that segregated schools remained largely intact in 1964, a decade after the initial *Brown* decision. Similarly, ten years after *Brown* in 1964 only an estimated 1.2% of Black students in the eleven states of the old Confederacy attended public schools with White children (Strum, 2002). Eventually, however, with active enforcement of the federal courts and the Civil Rights Division of the Justice Department, particularly from the mid-1960s to approximately 1980, the vast majority of the school districts were integrated that had formerly been segregated by law (*de jure*).

During the nearly 50 years since the Supreme Court rendered the initial *Brown* decision, numerous scholars from a variety of disciplines (law, political science, social policy, sociology, education, psychology, history, etc.) and policy analysts have expended much time, energy, and ink examining and re-examining the various elements of the *Brown* decision and its progeny. Nearly every possible position that can be argued about its benefits, shortcomings, tradeoffs, and long-term effects for White and minority students has been debated. While some scholars contend that African American students have received equal and greater educational opportunities as a result of *Brown*, others claim that tradeoffs such as demotion of Black principals, closing of formerly Black schools, busing of Black students out of their neighborhoods, and the quality of the

education received by African American students in integrated settings have been detrimental to them. While the vast majority of Black Americans generally supported the decision, Black responses ran the gamut from elation to occasional opposition. In the oppositional camp were Black cultural racialists like anthropologist Zora Neale Hurston who strongly believed in the strength of all-Black institutions and eschewed the implications of inferiority embraced by proponents of integration, “with its insinuation that ^{Black} school children could learn best under the tutelage of White teachers, sitting next to White students” (Martin, 1998). In the main, the research findings and conclusions appear to be inconclusive on both the efficacy of and the long-term results stemming from the *Brown* decision.

Given the paucity of current data that depicts the current participation of high school students by racial makeup, the authors decided to survey and interview a small sample of current and former high school principals to get a more accurate portrayal of student participation rates. This article includes a summary of these principals’ views regarding the legacy of the *Brown* decision relative to its impact on students, and it also provides their views on Black student activities and leadership in high schools in two states in the Deep South in 2004.

BACKGROUND CONTEXT AND THEORETICAL FRAMEWORK

Immediately after the United States Supreme Court rendered its decision in *Brown v. Board of Education of Topeka*, legal scholars, political scientists, and policy wonks began the process of examining what that decision had wrought. This process has continued, unabated, to the current time and will likely continue for the foreseeable future. Given that the court had concluded in its decision that *de jure* segregated education was inherently unequal, many thought, particularly African Americans, that equal educational opportunities would be forthcoming in a timely manner. Perhaps this was fostered by the jubilation arising from the decision, which was certainly justifiable; for even Thurgood Marshall, the lead attorney who had shepherded the case through its arduous journey to the Supreme Court, indicated that he was “numb” (essentially awestruck) when the decision was announced. However, as the saying goes: “the wheels of justice turn slowly;” and, in the case of the *Brown* decision, they indeed did turn slowly. Political scientists have a theory that explains this. In American policy making, when an authoritative decision affecting public policy is rendered by a governmental entity (legislative, judicial, or executive), it is necessary to see whether or not anything happens as a consequence of the decision. In the case of the judiciary branch (including the Supreme Court in *Brown*), the courts depend heavily upon assistance from the legislative and executive branches of government as well as general public support to promote compliance with their decisions (Schubert, 1965). It has been noted that where such assistance and support is lacking, decisions go unheeded (Campbell, Cunningham, Nystrand, & Usdan, 1985; Rosenberg, 1991).

Given the foot dragging in those states in which the *Brown* decision was most applicable as they left the Court’s mandate unheeded and ignored, a major dilemma was presented to the Court. How could the nation’s highest court maintain its authority and respect if one of its most profound decisions was defied and ignored? Some scholars have been critical of President Eisenhower for his limited support and active involvement in enforcing the Court’s decision, including using the “bully pulpit” of his office (Wirt & Kirst, 1975). Some argue that his weak support of the decision and its enforcement emboldened southern Governors such as Orval Faubus of Arkansas and George Wallace of Alabama to resist the Court’s order. Later, however, events surrounding the integration of Central High School in Little Rock in 1957 forced President Eisenhower to send federal troops in to enforce the decision. Sarratt (1966) provides a comprehensive view of the reactions of southern governors and legislators to the *Brown* decision.

For nearly a decade after the *Brown* case was decided, the Supreme Court was essentially silent on school desegregation. Its role principally involved upholding desegregation decisions from lower federal courts (Wirt & Kirst, 1975). With the passing of time, the executive branches of the federal and state governments gradually began to employ both carrot and stick approaches to force school districts to integrate their schools. The most potent stick employed was the federal

government's power, under the Civil Rights Acts of 1964 (discussed below), to cut off federal funds to any school district practicing discrimination. Moreover, during this same time, many scholars, particularly social scientists, had begun to conduct research, publish white papers, hold conferences, and advocate the efficacy of integrated schools and integrated educational experiences. These efforts gradually began to affect and change public attitudes to more favorably embrace desegregation.

Concurrently, other national events were occurring in America that also served to affect attitudes toward a more integrated society. The National Association for the Advancement of Colored People (NAACP) had served as the vehicle through which Attorney Thurgood Marshall had pursued numerous school desegregation cases. In fact, cases from the states of Kansas, South Carolina, Delaware, and Virginia were combined into *Brown v. Board of Education of Topeka*. Washington, DC school officials were ordered to desegregate in a separate case (*Bolling v. Sharpe*) decided the same day (Hendrie, 2004). Almost immediately after the *Brown* decision came down, the NAACP became involved in the highly successful Montgomery bus boycott led by Dr. Martin Luther King, Jr. which served as a springboard to launch his national prominence as a civil rights leader and eventually led him to the nation's capital to deliver his "I Have a Dream" speech. These successful endeavors served to further strengthen and enhance the national stature of the NAACP and solidify its reputation as a vehicle for advancing equal opportunities for African Americans.

Around the same time, after the assassination of President Kennedy, Vice President Lyndon Johnson became President, and he quickly began a monumental effort to pass new laws on civil rights and to enforce the desegregation of schools and desegregation of all public accommodations. Thus, after nearly a decade of inactivity on desegregation from the executive branch of the federal government, under President Johnson, it began to actively address the evasion practices of school districts, particularly in states in the Deep South. The federal courts, including the Supreme Court, began an active period of hearing desegregation cases. It was also during the Johnson Administration that the Civil Rights Act of 1964 was passed, which required, through Title IV, the desegregation of public schools in the United States; through Title VI, prohibited discrimination in any programs or activities receiving federal assistance; and, through Title VII, required equal employment opportunities in schools (1964). Thus, the Congress, through the Civil Rights Act of 1964, mandated the desegregation of public schools, prohibited discrimination in all school programs and activities, and assured equal employment opportunities to all school employees. However, in terms of school desegregation, the central core of the Civil Rights Acts of 1964 appeared in Title VI which states:

No person in the United States shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance. (Section 601, ¶ 1, 1964)

This section of the act clearly provided the requisite muscle to force school districts to either desegregate or risk losing all federal funding. Given the large infusion of federal funding that was made available to school districts, particularly through the Elementary and Secondary Education Act (ESEA) of 1965, very few school districts could risk the political backlash that would come from losing this funding directed toward disadvantaged students and other sources of federal funding for library support, equipment, vocational education, etc.

Given the legal mandates that were enacted to dismantle segregated schools, one might conclude that the schools would have been integrated expeditiously. As noted earlier, however, this was not the case. A very long, protracted, and litigious period followed the *Brown* decision, particularly during the first two decades (1954-1974) as proponents of desegregated schools fought to integrate schools in those states that had previously operated dual school systems for Blacks and Whites. While the focus and length of this article does not allow adequate treatment of this period, others have focused extensively on the arduous journey toward integrated schools in America (Crain, 1966; Crain, 1968; Irons, 2002; Kluger, 1975; Orfield, 1969; Orfield & Eaton,

1996; Orfield & Joint Center for Political Studies, 1983; Patterson, 2001; Peltason, 1961; Tushnet, 1994; Willie, 1978).

In this article, the authors' conceptual framework is based on the premise that, given the level of resistance to the *Brown* decision, serious difficulties were encountered in implementing the decision during the first 50 years; moreover, given the level of resistance that still exists toward active efforts to integrate schools, difficulties are still encountered by school policy makers and school officials in their efforts to create and sustain integrated schools. This premise is explored in terms of how it has affected public school teachers and schooling and how it has affected students. A half century after the *Brown* decision was rendered, some scholars contend that the public schools are still not racially integrated or equitably funded (Strum, 2002), which was a fundamental intent of the Court's ruling. There are multiple reasons why the integration of schools in America has been an elusive goal. These include, but are not limited to, the following: racism, preferences for neighborhood schools, anti-busing ideology, inequities of the busing burden borne by Black students, dismissal of Black principals and teachers, closing of formerly Black schools, tracking of Black students in integrated schools, disproportionate number of Black students placed in special education programs, perceived inequities in schools serving predominately minority students—to name a few.

IMPACT OF *BROWN* ON BLACK PRINCIPALS AND TEACHERS

In the aftermath of the Supreme Court's ruling in *Brown v. Board of Education*, there was much jubilation and anticipation by Black educators, fueled by the belief and hope that long awaited equal and better opportunities for both Black students and Black educators had finally arrived. This optimism, although warranted, proved to be somewhat hollow, however, as numerous factors conspired to delay and frustrate implementation of the Court's order. Even the three branches of the federal government, the judiciary, legislative, and executive, contributed significantly to the delay.

One of the first negative impacts for Blacks stemming from desegregation was the dismissal and demotion of Black principals and teachers (Arney, 1978; Hawkins, 1994; King, 1993). In 1954, when the *Brown v. Board of Education* decision was handed down, there were 82,000 Black teachers (Hawkins, 1994). By 1964, 38,000 Black teachers and administrators had lost their positions in 17 southern and Border States (Ethridge, 1979; Holmes, 1990). During the 3-year period from 1967 to 1970, the number of Black principals in North Carolina declined from 670 to 170; in Alabama from 250 to 40; in Mississippi from 250 to almost zero (Haney, 1978). Balkin (2002) contends that, as a result of the displacement of such a large number of Black administrators and teachers, a whole generation of Black educators was lost. Organizations such as the NACCP Legal Defense and Educational Fund, the Dushane Fund of the National Education Association, local NACCP branches, and local Black community leaders provided counsel and occasional financial assistance to displaced and dismissed teachers and administrators (Bradley, 1999).

While it is difficult to find empirical studies explaining how and why these Black educators were displaced or dismissed, it might be hypothesized that there were likely multiple reasons. Since many of the formerly all-Black schools were closed, many principals and teachers in them were displaced. As a result of closing many formerly Black schools, the principals were either dismissed or reassigned as assistant principals, often serving under White principals with less experience as a principal. Since the vast majority of principals in the integrated schools were White, they likely gave preference to keeping and employing White teachers. Given that few tenure laws and reduction in force (RIF) policies were in place in the states most affected by the mandate to desegregate, Black principals and teachers had little recourse to contest displacements and dismissals. Moreover, since the majority of school board members and superintendents in the states most affected were White, preferences were likely given to retaining and employing White principals and teachers. Undoubtedly, racism also had a role in how decisions were made and implemented.

What was the impact of the exodus of 38,000 Black administrators and teachers from the classroom in a decade? Both Foster (1990; 1993) and Franklin (1990) have addressed this. Foster (1993) has observed that up until the 1960s, African American teachers were most likely teaching African American students. However, Holmes (1990) has noted that a cycle developed between 1960 and 1990 in which fewer students of color have been taught by teachers of color. This cycle (addressed in more detail in a later section) is pervasive and has continued to the present and will likely continue in the foreseeable future. A number of scholars and commission reports contend that this cycle has now reached a near crisis stage, as many African American students are now matriculating through elementary and high school while having few if any African American teachers. Some prominent scholars who have been examining this and its related implications include Sabrina King, J. E. King, Linda Darling-Hammond, Lisa Delpit, Michele Foster, Asa Hilliard, G. P. Smith, Diane S. Pollard, Christine E. Sleeter, Gloria Ladson-Billings, James A. Banks, and Cherry A. McGee-Banks—to name a few.

It should be noted, however, that in recent years there has been a slow but steady increase in the numbers of African American and other people of color, including women, in principal positions. In contrast to the era of segregated schools, however, these African American principals are likely today to serve in schools where the majority of the teachers are White and the majority of the students are from African American or other minority groups and are likely to be poor (Pollard, 1997). Conversely, however, the number of African American teachers continues to decline.

After it became clear that some degree of school integration was a *fait accompli* in those states that had operated segregated schools, a variety of techniques were employed to minimally comply with the law. These techniques included freedom of choice plans in which students were, in theory, allowed to attend schools that they could not formerly attend due to their race. Although a few Black parents elected to send their children to formerly all-White schools, almost no White parents elected to voluntarily send their children to formerly all-Black schools. When this strategy failed to satisfy federal officials who were increasingly pushing school districts to desegregate, other strategies were employed.

One strategy employed by local school districts was to carefully select a smattering of what was deemed to be the better Black teachers and assign them to formerly all-White schools. Similarly, with encouragement, a small number of White teachers volunteered to transfer to formerly Black schools (Madsen & Hollins, 2000). Initially, it was not uncommon to find several White teachers in schools in which no White students were enrolled. Also, a small number of Black students were allowed to transfer to formerly all-White schools. In many cases, these were children of middle class Black parents who believed that their children would receive better educational opportunities if they attended integrated schools. Moreover, frequently with support of organizations such as the local NAACP, Black community activists also elected to send their children to formerly all-White schools. Although local school boards and school officials wanted to be able to show that they were indeed making progress toward integrating the schools, due to stepped up efforts by the federal government to force districts to integrate, it was “too little, too late.” From the decade from 1965 to 1975, the federal courts and the Civil Rights Division of the Justice Department aggressively used their judicial and executive authority, respectively, to order and force recalcitrant school districts, particularly in the Deep South, to develop acceptable desegregation plans and to subsequently implement them. One notable example was the *Swann v. Charlotte-Board of Education* (1971) case in which the U. S. Supreme Court ruled that school districts were obligated to “eliminate invidious racial distinctions and...produce schools of like quality, facilities, and staff” and affirmed the power of the district court to order school busing as a remedy for integrating schools.

IMPACT OF *BROWN* ON BLACK HIGH SCHOOL STUDENTS

Scholars have expended much time, effort, and energy seeking to determine the long-term impact of the Supreme Court's *Brown v. Board of Education of Topeka* decision on Black students in America's schools. Almost every conceivable advantage and disadvantage has been presented, discussed, and debated in the past and will likely continue to be examined and debated in perpetuity. While space here does not allow a comprehensive discussion of all of the salient arguments for and against the decision vis-à-vis Black students, most of them revolve around two fundamental views.

The first argument, which generally supports and embraces the *Brown* decision, contends that the Court's ruling served to crystallize the message to the nation that state mandated or sanctioned segregation of schools was unconstitutional and that segregated schools did not provide equal educational opportunities to Black students. Moreover, although ostensibly operating under the separate but equal premise promulgated by *Plessy v. Ferguson*, overwhelming evidence was provided during the litigation process that schools in states that maintained separate schools by race were not equal based on any measure. Advocates of this position subscribed to the notion that, by desegregating the schools, Black students would be able to access the same educational resources and opportunities as White students such as smaller classes, a stronger, broader curriculum, better paid and qualified teachers, more and better instructional materials, newer and better facilities, newer and better school buses, and, most important, better opportunities to prepare themselves for life beyond elementary and secondary school.

As noted above, the teaching profession in the United States has become increasingly White while the student population has become increasingly minority and diverse. This has caused numerous scholars to examine and discuss the phenomenon whereby a predominately White teaching force is now teaching students of color. While the Hispanic student population is rapidly increasing, in those states most affected by the *Brown* decision, the vast majority of these minority students are Black. Ironically, the *Brown v. Board of Education* decision is frequently cited as one of the major reasons for the decline of the percentage of Black teachers (Hudson & Holmes, 1994), for it is deemed by many to be the most significant event of the 20th century that reduced both segregation and discrimination and opened the doors of opportunity for Black Americans. Hence, no longer limited to careers such as teaching, social work, and nursing, the majority of Black college students are now pursuing studies in other fields, particularly those offering higher salaries, status, and prestige. Thus, the proponents of the *Brown* decision argue, several generations of Black students have been able to pursue better education, careers, professions, corporate positions, and myriad other opportunities that were formerly beyond their reach before an integrated society was made a reality by the Supreme Court's ruling.

The second school of thought relative to the *Brown* decision is concerned with whether Black students, in general, have materially benefited during the last 50 years, particularly given today's teacher and student demographics. Various scholars have examined and written about this issue or some variation of it. With the continuing decrease in the ratio of Black teachers in schools today vis-à-vis the ratio of students, some have lamented the fact that the vast majority of Black students have a sharply declining number of Black teachers to serve as role models for them. For example, Mercer and Mercer (1986) contend that "(operating) a public school system without Black teachers is (like teaching) white supremacy without saying a word" (p. 105) and that the shrinking African American pool of teachers is partly a consequence of how *Brown* was implemented by White policy makers. King (1993) has noted that, in addition to serving as positive role models for students, many of whom do not have much exposure to them in their communities, African American teachers also tend to serve as surrogate parents, disciplinarians, counselors, and advocates for African American students.

Other scholars have questioned if White teachers, most of whom have middle-class backgrounds, have life experiences that equip them to sympathize with and address social justice issues such as racial inequities, discrimination, social class, etc. Sleeter (1993) among others, questions if, given this cultural incongruence, most White teachers can address these issues with

Black students without demeaning them or questioning their own privileges. From a similar perspective, Davidson (1996) has argued that schools are the main arenas where students learn the meaning of a society's social categories such as race, multi-racial families, ethnicity, and social economic status in order to understand and construct their own personal identities. Perhaps this is why scholars, such as Pollard (2002), question if students can be adequately socialized and fully educated without adequately studying these areas. Moreover, perhaps this is why Black students frequently gather together to discuss issues that are not formally addressed in the classroom. This is a fundamental thesis of Tatum's (1997) book, *Why Are All the Black Kids Sitting Together in the Cafeteria?*

Similarly, Sleeter (1993) and Miron (1997), among others, have questioned if most White teachers hold high expectations for Black students given the prejudiced attitudes and stereotype views held by many Whites, especially toward disadvantaged Blacks. Other scholars have argued that minority students are actually damaged when they are sent to predominately White schools because their cultures are denigrated in majority-controlled schools (Cummings, 1986; Dehyle, 1995; Stanton-Salazar, 1997). Also, a number of scholars, such as Delpit (1995), Ladson-Billings (1994), and Foster (1997), have addressed whether most White teachers are sensitive to and knowledgeable of the most effective learning styles and interaction patterns peculiar to Black students. In general, they argue that, if teachers are to be maximally effective with Black students, they need to have some understanding of African American culturally relevant pedagogy. For example, it has been observed that Black students learn more effectively through cooperative learning activities than through whole class or individual teaching strategies (Sleeter, 1993). Others, such as Irvine and Fraser (1998), contend that Black teachers more frequently use students' everyday culture and historical experiences in teaching; employ a livelier, emotional, creative, and spontaneous teaching style filled with rhythmic and figurative language; employ a more personal relationship with their children; and perceive themselves as parental surrogates and advocates for African American students.

In spite of the above observations, however, it would be fallacious to conclude that most White teachers are not effective in teaching minority students in general and African American students in particular. Given the recently noted demographics of the teaching force in the United States, which showed that 90% of public school teachers were White and 6% were Black during the 2000–2001 school year (Keller & Manzo, 2003), it is evident that the vast majority of African American students are taught by White teachers. Since the academic achievement gap between White and Black students is generally declining, many White teachers are obviously having success teaching African American students. Notwithstanding, however, Black students do experience some unique challenges in integrated school settings.

Researchers have documented that in integrated school settings a disproportionately higher number of Black students are placed in special education classes (Shapiro, 1971; Shapiro, Loeb, Bowermaster, Wright, Headden, & Toch, 1993). For example, the Harvard Civil Rights Project researchers found that African American children, especially Black males, are identified at one and a half to four times the rate of White children in the disability categories of mental retardation and emotional disturbance (Orfield & Losen, 2002). They also found that when minority children are placed in special education, all too often they experience inadequate services, low quality curriculum and instruction, and unnecessary isolation from their peers. Additionally, once identified, they found that minority children are more likely to be removed from the general education program and placed in a more restricted (educational) environment.

In a similar vein, others have argued that Black students are likely to be more harshly disciplined in integrated schools settings (Irvine, 1990). Also, it has been observed that they are often disciplined for more subjective infractions such as disrespecting authority, talking back, etc., whereas White students are more likely to be punished for more objective infractions such as smoking, drug offenses, etc.

Moreover, there is evidence that Black students are more prone to be tracked and placed in less academically rigorous programs and courses in integrated schools (Goodlad & Keating, 1990; Oakes, 1985). Frequently, this is referred to as second generation segregation (Mickelson, 2001;

Spring, 2002). This is a pervasive problem that has been documented by researchers such as Mickelson in a recent comprehensive study of integration in the Charlotte-Mecklenburg (North Carolina) Schools. As a consequence, when students assigned to low tracks leave high school they are less prepared to enter colleges and universities to pursue studies leading to higher status careers, greater earning capacity, and more economic, political, and social influence. Unless specific steps are taken to encourage African American students to pursue a rigorous course of study, many will not do so voluntarily, particularly when they are underrepresented in these programs and courses in their schools.

PERCEPTIONS OF FORMER AND CURRENT HIGH SCHOOL PRINCIPALS

To elicit some empirical data regarding how the *Brown v. Board of Education of Topeka* decision has impacted students during recent years, the authors surveyed current and recently retired African American high school principals in the states of Alabama and North Carolina to determine their perceptions regarding selected issues affecting staff and students in integrated schools today. These principals were chosen because they were in two of the states in the Deep South that had *de jure* segregated schools prior to the *Brown* decision. The fundamental purpose of the study was to determine if these principals and former principals believed that the *Brown* decision has positively affected the educational opportunities of African American students five decades after the decision was rendered. A secondary purpose of the study was to determine how these principals perceive that African American high school students are generally thriving or failing to thrive in high schools in these two states in 2004, 50 years after the *Brown* decision.

To solicit the data from the subjects, a twenty-item questionnaire was developed that was sent to approximately 25 current and former high school principals in both Alabama and North Carolina. The questionnaire was designed to elicit their opinions to answer three basic questions: (a) How does the make-up of the current teaching force affect African American Students?; (b) Have African American Students benefited from the *Brown* decision?; and (c) Do African American students have equal educational opportunities today? Of the 50 questionnaires sent out, 36 were completed and returned to the authors. In addition to collecting information via questionnaires, the authors also conducted telephone interviews with a dozen respondents to gain a more in-depth understanding of the subjects' perceptions, and to solicit some additional information regarding the participation of African American students in extra-curricula activities. The interview protocol used by the authors asked the respondents to respond to the following six questions:

1. Do you believe that African American students generally have full and equal opportunities to serve in high school leadership roles today?
2. Do you believe that African American students normally will seek student leadership positions in integrated high schools?
3. In which student organizations/clubs do African American students tend to seek leadership roles?
4. In which student organizations/clubs are African American students least likely to participate?
5. In which student organizations/clubs are African American students most likely to participate?
6. Do African American students have an equal opportunity to be selected for cheerleading squads where the criteria for selection is likely to be more subjective (size, beauty, charm, agility, etc.)?

DISCUSSION OF FINDINGS

To compare the responses from respondents in Alabama and North Carolina, statistical analyses were conducted, using a *t* test. The only item on which the responses from respondents in the two states were statistically significantly different was to the following question: Do you believe that an acceptable number of African American school staff members are employed to serve as

positive role models for African American students? On a 1 (Not at All) to 5 (Absolutely Yes) scale, this was rated 2.00 by North Carolina respondents and 3.24 by Alabama respondents. This suggests that, in comparison with Alabama respondents, North Carolina respondents perceive that more African American school staff members are needed to serve as role models for African American students. Other key findings include the following:

1. Respondents in both states indicated that the *Brown* decision has benefited African American students.
2. Respondents in both states **strongly** indicated that African American students need to have some African American teachers during their K-12 school experience.
3. Respondents in both states **strongly** indicated that the curriculum today does not adequately address the history, culture, and experiences of African Americans.
4. Respondents in both states **strongly** indicated that *all* students benefit by having some African American teachers.
5. Respondents in both states **strongly** indicated that it is not a good policy to assign African American students to schools that serve primarily poor students.
6. Respondents in both states **strongly** indicated that African American principals have special challenges when they supervise a staff of predominately White teachers in schools that enroll mostly African American students.
7. Respondents in both states **strongly** indicated that the shortage of African American teachers is a serious problem today.
8. Respondents in both states **moderately** indicated that African American students generally have equal educational opportunities today.

Only 6 (50%) of the 12 interviewees indicated that they believed African American students have full and equal opportunities to serve in leadership positions in high school today. The others mostly agreed that the opportunities are there, but barriers usually exist that negate African American students from assuming leadership roles. Collectively, they generally noted that, to be elected to leadership roles, African American students need to: have always attended integrated schools; have good grades and be popular with students, teachers, and the administration; and reflect the views and values of the White faculty, who usually constitute the majority. Additionally, several interviewees noted that to be selected as a leader a student needed to attend a progressive school with a healthy racial climate where both the administration and staff value diversity. The vast majority of the respondents noted that African American students usually need to be encouraged and pushed to seek leadership positions because they are reluctant to run for elected positions if they do not believe that they can win.

In particular, the authors used the interviews to solicit information regarding the degree to which African American students have generally served in leadership capacities in school organizations and activities during recent years. Table 1 summarizes the information gleaned from the respondents regarding African American student participation in various student organizations and activities.

The data presented in the Table 1 clearly show that, based upon the information provided by the respondents during the interviews, African American students are underrepresented in terms of participation in school organizations and activities with a very few exceptions. There are only three school organizations or activities in which the interviewees indicated that African American students participate at a high or very high level: Band, Basketball, and Football. Also, the interviewees indicated that African American students highly participated in organizations specifically related to their interests such as the student NAACP, Black History Month Club, Gospel Choir, etc. While the results may be disheartening to some, it is consistent with previous research in this area. McNeal (1998) and Clotfelter (2002), both of whom have recently conducted research on high school student racial participation in extracurricular activities, also found that African American students tended to be underrepresented in most school organizations and activities with the exception of a few. One respondent noted that African American students are

not as likely to seek “resume filler” leadership positions in school organizations to include on college applications to gain admission. Several respondents noted that many African American students are reluctant to even join student organizations that do not have African American members for fear of being ostracized by friends. It should be noted, however, that this has also been found to be true of White high school students who tend to not participate in (non-athletic) school organizations when the majority of members are African American (Clotfelter, 2002).

Table 1

Interviewee's Perceptions of African American Student Participation in High School Organizations

Student Organization/Activity	Usual Level of Participation By African American Students				
	None or Very Low	Low	Average	High	Very High
<i>Non-Athletic Organizations</i>					
Honor Society/Beta Club, etc.	x				
Student Government		x			
Subject Related Clubs (i.e., Math, Science, Spanish)		x			
Vocational Clubs (DECA, VICA, HOSA, FBLA, etc.)			x		
Junior ROTC			x		
Service Clubs (Red Cross, etc.)*		x			
Debating Team		x			
Yearbook		x			
School Newspaper		x			
Band				x	
Choral Group**		x			
<i>Athletics</i>					
Baseball Team	x				
Basketball Team					x
Football Team				x	
Golf Team	x				
Tennis Team		x			
Soccer Team	x				
Track & Field Team			x		
Cheerleading Squad			x		

* Participation is usually high in organizations such as Student NAACP.

** Participation is usually very high if there is a predominately Black Gospel Choral Group.

Several respondents also observed that African American students appear to have a disadvantage in gaining admission to school honor societies where the criteria for selection are a combination of academic achievement, character, and attitude. In addition to the problems African American students have in getting the grades required for admission, which are sometimes derived subjectively by teachers, the respondents observed that students must have good character and the “right attitude” to be accepted. Thus, due to differences in culture, values, manners, behavior patterns, etc., a student meeting the academic requirements might be kept out of the honor society due to his or her, presumably, bad attitude.

The student activity that has historically been the most troubling since schools were integrated in the Deep South has been the cheerleading selection process. In her insightful book,

Learning to Win : Sports, Education, and Social Change in Twentieth-century North Carolina, in which she discusses this in greater detail, Grundy (2001) observes that the selection of cheerleading squads became one of the most volatile school desegregation issues around the South as students at numerous schools staged walkouts and protests over the issue. According to the interviewees, this is the student activity that is still the most troubling in schools with integrated student bodies. In the respondents' schools, the cheerleading squads ranged from all-White to all-African American, with approximately one-third being integrated. Unlike other athletic activities in which one's skill can be clearly and publicly demonstrated when players are competing for spots on a team, the selection of cheerleaders is more subjective, political, emotional, and cumbersome. One respondent noted that the selection of cheerleaders is often a power game, actively participated in by parents. Over half of the interviewees noted that it was extremely difficult to select and maintain a racially integrated cheerleading squad without having a quota system, which formerly was the case in the early days of integrated schools but is now generally deemed undesirable. While over half of the respondents noted that African American girls were usually on their cheerleading squads, most noted some of the complexities surrounding this activity. Some cited include the following: Being able to afford the costs of cheerleader camp (which negatively affects less affluent students who are often African American); expectation of a certain "look" in hairstyle, dress, figure, appearance, etc. (these were also cited by Grundy [p. 287] as criteria used for selecting cheerleaders); expectation that African American cheerleaders live in middle-class and mixed neighborhoods; attitude of the cheerleader sponsor/advisor; racial climate in the school; and selection process employed—to name a few. Given the responses of the interviewees, cheerleading is likely to be an area of concern for years to come.

Based upon the overall responses, the twelve principals and former principals generally perceive that, given the way things were prior to 1954, the *Brown* decision has generally served to provide better educational opportunities and experiences for African American students. They did indicate, however, that due to a variety of reasons, much remains yet to be done to bring the hopes and aspirations envisioned from the *Brown* decision to fruition. In particular, they believe that African American students and *all* students desperately need to have exposure to more African American teachers and administrators as role models; the curriculum needs to be revised to include more aspects of African American history and culture; school staff members, particularly teachers, need to better understand and embrace diversity; and African American students should not be primarily assigned to schools with poor, minority students.

CONCLUSION

Given the progress that has been made in education—and in the broader society—due to the 1954 *Brown v. Board of Education of Topeka* Supreme Court decision, social scientists, educational policy makers, and educational practitioners generally agree that it has positively affected educational opportunities and experiences of students at all levels and, equally important, opened doors of opportunity for students to improve their life chances, pursue their career goals, and their personal aspirations. Perhaps most important, the *Brown* decision served to send a message across America that the principles upon which the country were founded such as freedom and equality were applicable to all (Hendrie, 2004). Moreover, the Supreme Court's decision sent a forceful message across the national landscape that it was time for the nation to live up to its ambitious creed that "all men (and women) were created equal." Accordingly, it was inherently illegal to relegate a large proportion of America's youth to decrepit, ill-equipped, and under-resourced schools. Albeit slowly, particularly in the Deep South where Jim Crow laws and their progeny had prevailed until the 1950s, the decision served to prick the consciousness of Americans once the severity of the problem of segregated schooling gained national and international exposure. As Hendrie observes, "By today's standards, the notion that Black children could be consigned to separate schools solely because of their skin color...seems unconscionable" (p. 1).

However, our research indicates that there were tradeoffs that were experienced by African American teachers, administrators, and students as they eventually experienced integrated

schooling. As the protracted, painful, and contentious drama of the implementation process played out across the country, particularly in the first two decades after the decision was rendered, many individuals paid a high price while often playing heroic roles. For example, thousands of African American principals and teachers lost their jobs, or were displaced or demoted. More than a few African American students risked life and limb trying to enroll in integrated schools, in elementary and secondary schools as well as colleges and universities. Numerous formerly all-Black schools, which had served as beacons in the community, were closed and their students were bused to schools outside of the communities to unfamiliar schools and teachers where they sometimes felt unwelcome. The closing or conversion of formerly all-Black high schools was particularly painful as they usually ranked very close to the church in terms of the affinity that students, parents, graduates, and the community held for them. This strong support was generously bestowed upon school activities such as athletics, the marching band, choral and drama groups, etc. Moreover, leadership positions in these schools were obviously held by African American students. Principals and teachers in these schools often remained for several decades, sometimes for their entire careers. In many cases, they taught several generations of families and, most frequently, several siblings from the same family. Ironically, due to segregated neighborhoods, principals and teachers usually lived in the communities of their students and served as both in- and out-of-school role models.

With the opening up of opportunities in society stemming in a great part from the *Brown* decision, many African American students, who formerly would have become teachers, elected to pursue fields of study providing higher salaries and more prestige. Segregated schools and discrimination, in combination, had served to restrict Black college graduates to career fields such as teaching. Over time, the percentage of African American teachers has declined precipitously. It should be noted, however, that other factors have contributed to this decline such as teacher licensure examinations, more stringent certification requirements, five-year teacher education programs, relatively low salaries, and accountability pressures. The effect of this means the vast majority of African American students are now taught by White female teachers—a phenomenon that becomes more pervasive each year.

As African American students entered integrated school settings, many had and are still having great challenges. Disproportionately, numerous studies have shown that they, particularly Black males, are placed in special education classes where they often experience inadequate services, a low quality curriculum, inadequate instruction, and unnecessary isolation. In some states, particularly in the Deep South, Black students are identified at one and a half to four times the rate of White students and, once placed in special education, they frequently remain there for most of their K-12 school years. There is also documented evidence that African American students are likely to be placed in less-challenging academic tracks and courses in integrated schools that leaves them less prepared to enter college and pursue studies leading to higher status careers, greater earnings, and more economic, political, and social power. In a similar vein, there is some evidence that African American students, usually males, are likely to be more harshly disciplined in integrated schools settings and punished for more subjective infractions.

From the study of former and current high school principals, the authors sought to identify salient issues affecting African American teachers in integrated schools and determine the extent that African American students participate in school activities and hold leadership roles in activities in integrated schools. All of the respondents strongly believed that African American and all students would benefit by having some African American teachers, and they all believed that integrated schools do not devote adequate attention to African American history and culture to the extent that is warranted. Most believed that a disproportionate burden is placed upon a decreasing number of African American teachers and administrators to serve as role models for African American students. Moreover, they perceive that African American principals often have special challenges when they serve in schools with predominately African American student populations when the teaching staff is predominately White. While most respondents indicated that Black students today have the opportunity to participate in any and all student activities, some indicated that in practice this is not the case. For example, one noted that, at one point in her school,

yearbook staff members were expected to sell a minimum number of advertisements. She noted that this served as a disadvantage for some students, many of whom were African American, who did not have the business contacts and networks of many middle-class White students.

The interviewees indicated that there are only three school activities in which African American students consistently participate at a high or very high level: band, basketball, and football. However, they also indicated that Black students participate at a high level in those activities and clubs that are geared toward their interests such as NAACP, Gospel Choir, Black History Month Club, etc. Nevertheless, the responders indicated that most student activities, with the exception of a few, have very limited African American student participation and that the sports of soccer, baseball, and golf have virtually no Black student participation. Additionally, they noted that African American students are reluctant to run for office or seek leadership positions unless they are encouraged to do so. Moreover, they indicated that African American students are unlikely to seek elected leadership positions unless they believe they can win. The troubling finding was that, in the majority of the interviewees' schools, the racial climate has not yet reached the point where African American students believe that all students will vote for them regardless of race. Given the difficulty that African American candidates often have in elections at the local, state, and national levels in American society perhaps it should not be surprising that high school students have not yet begun to broadly vote for candidates regardless of their racial or ethnic background.

The findings of a recently released report by The Civil Rights Project at Harvard University showed that during the last decade there has been a substantial return to segregated schools, particularly in the South where court decisions and civil rights laws had produced the most integrated schools in the nation for three decades (Orfield & Lee, 2004). Ironically, the authors note that it was the Supreme Court's *Dowell v. Oklahoma City*, which authorized a return to segregated neighborhood schools. Consequently, given the overall progress that has been made during the last fifty years, it is difficult to be optimistic that the noble goals envisioned by the supporters of the Supreme Court's *Brown* decision will be coming to fruition in the foreseeable future. They are unlikely to be achieved "with all deliberative speed."
